Abstract

Stochastic differential equations (SDEs) and the Kolmogorov partial differential equations (PDEs) associated to them have been widely used in models from engineering, finance, and the natural sciences. In particular, SDEs and Kolmogorov PDEs, respectively, are highly employed in models for the approximative pricing of financial derivatives. Kolmogorov PDEs and SDEs, respectively, can typically not be solved explicitly and it has been and still is an active topic of research to design and analyze numerical methods which are able to approximately solve Kolmogorov PDEs and SDEs, respectively. Nearly all approximation methods for Kolmogorov PDEs in the literature suffer under the curse of dimensionality or only provide approximations of the solution of the PDE at a single fixed space-time point. In this paper we derive and propose a numerical approximation method which aims to overcome both of the above mentioned drawbacks and intends to deliver a numerical approximation of the Kolmogorov PDE on an entire region $[a, b]^d$ without suffering from the curse of dimensionality. Numerical results on examples including the heat equation, the Black-Scholes model, the stochastic Lorenz equation, and the Heston model suggest that the proposed approximation algorithm is quite effective in high dimensions in terms of both accuracy and speed.
1 Introduction

Stochastic differential equations (SDEs) and the Kolmogorov partial differential equations (PDEs) associated to them have been widely used in models from engineering, finance, and the natural sciences. In particular, SDEs and Kolmogorov PDEs, respectively, are highly employed in models for the approximative pricing of financial derivatives. Kolmogorov PDEs and SDEs, respectively, can typically not be solved explicitly and it has been and still is an active topic of research to design and analyze numerical methods which are able to approximately solve Kolmogorov PDEs and SDEs, respectively (see, e.g., [17], [20], [21], [27], [28], [29], [32], [40], [41], [42], [43], [45], [46], [47], [49], [52]). In particular, there are nowadays several different types of numerical approximation methods for Kolmogorov
PDEs in the literature including deterministic numerical approximation methods such as finite differences based approximation methods (cf., for example, [7], [8], [23], [13], [58], [56]) and finite elements based approximation methods (cf., for example, [9], [10], [59]) as well as random numerical approximation methods based on Monte Carlo methods (cf., for example, [17], [20]) and discretizations of the underlying SDEs (cf., for example, [21], [27], [28], [29], [32], [40], [41], [42], [43], [46], [47], [49], [52]). The above mentioned deterministic approximation methods for PDEs work quite efficiently in one or two space dimensions but cannot be used in the case of high-dimensional PDEs as they suffer from the so-called curse of dimensionality (cf. Bellman [5]) in the sense that the computational effort of the considered approximation algorithm grows exponentially in the PDE dimension. The above mentioned random numerical approximation methods involving Monte Carlo approximations typically overcome this curse of dimensionality but only provide approximations of the Kolmogorov PDE at a single fixed space-time point.

The key contribution of this paper is to derive and propose a numerical approximation method which aims to overcome both of the above mentioned drawbacks and intends to deliver a numerical approximation of the Kolmogorov PDE on an entire region \([a,b]^d\) without suffering from the curse of dimensionality. The numerical scheme, which we propose in this work, is inspired by recently developed deep learning based approximation algorithms for PDEs in the literature (cf., for example, [3], [4], [14], [15], [16], [24], [26], [51], [57]). To derive the proposed approximation scheme we first reformulate the considered Kolmogorov PDE as a suitable infinite dimensional stochastic optimization problem (see items (ii)–(iii) in Proposition 2.7 below for details). This infinite dimensional stochastic optimization problem is then temporally discretized by means of suitable discretizations of the underlying SDE and it is spatially discretized by means of fully connected deep artificial neural network approximations (see (107) in Subsection 2.6 as well as Subsections 2.4–2.5 below). The resulting finite dimensional stochastic optimization problem is then solved by means of stochastic gradient descent type optimization algorithms (see (109) in Subsection 2.6, Framework 2.9 in Subsection 2.7, Framework 2.10 in Subsection 2.8 as well as (124)–(125) in Subsection 3.1). We test the proposed approximation method numerically in the case of several examples of SDEs and PDEs, respectively (see Subsections 3.2–3.6 below for details). The obtained numerical results indicate that the proposed approximation algorithm is quite effective in high dimensions in terms of both accuracy and speed.

The remainder of this article is organized as follows. In Section 2 we derive the proposed approximation algorithm (see Subsections 2.1–2.6 below) and we present a detailed description of the proposed approximation algorithm in a special case (see Subsection 2.7 below) as well as in the general case (see Subsection 2.8 below). In Section 3 we test the proposed algorithm numerically in the case of several examples of SDEs and PDEs, respectively. The employed source codes for the numerical simulations in Section 3 are postponed to Section 4.
2 Derivation and description of the proposed approximation algorithm

In this section we describe the approximation problem which we intend to solve (see Subsection 2.1 below) and we derive (see Subsections 2.2–2.6 below) and specify (see Subsections 2.7–2.8 below) the numerical scheme which we suggest to use to solve this approximation problem (cf., for example, E et al. [14], Han et al. [21], Sirignano & Spiliopoulos [57], Beck et al. [3], Fujii, Takahashi, A., & Takahashi, M. [16], and Henry-Labordere [26] for related derivations and related approximation schemes).

2.1 Kolmogorov partial differential equations (PDEs)

Let \( T \in (0, \infty), \ d \in \mathbb{N}, \) let \( \mu : \mathbb{R}^d \to \mathbb{R}^d \) and \( \sigma : \mathbb{R}^d \to \mathbb{R}^{d \times d} \) be Lipschitz continuous functions, let \( \varphi : \mathbb{R}^d \to \mathbb{R} \) be a function, and let \( u = (u(t, x))(t,x) \in C^{1,2}([0,T] \times \mathbb{R}^d, \mathbb{R}) \) be a function with at most polynomially growing partial derivatives which satisfies for every \( t \in [0,T], \ x \in \mathbb{R}^d \) that \( u(0, x) = \varphi(x) \) and

\[
\frac{\partial u}{\partial t}(t, x) = \frac{1}{2} \text{Trace}_{\mathbb{R}^d} (\sigma(x)[\sigma(x)]'(\text{Hess}_x u)(t, x)) + \langle \mu(x), (\nabla_x u)(t,x) \rangle_{\mathbb{R}^d}.
\]

Our goal is to approximately calculate the function \( \mathbb{R}^d \ni x \mapsto u(T,x) \in \mathbb{R} \) on some subset of \( \mathbb{R}^d \). To fix ideas we consider real numbers \( a, b \in \mathbb{R} \) with \( a < b \) and we suppose that our goal is to approximately calculate the function \( [a,b]^d \ni x \mapsto u(T,x) \in \mathbb{R} \).

2.2 On stochastic differential equations and Kolmogorov PDEs

In this subsection we provide a probabilistic representation for the solutions of the PDE (1), that is, we recall the classical Feynman-Kac formula for the PDE (1) (cf., for example, Øksendal [50, Chapter 8]).

Let \((\Omega, \mathcal{F}, \mathbb{P})\) be a probability space with a normal filtration \((\mathcal{F}_t)_{t \in [0,T]}\), let \( W : [0,T] \times \Omega \to \mathbb{R}^d \) be a standard \((\Omega, \mathcal{F}, \mathbb{P}, (\mathcal{F}_t)_{t \in [0,T]})\)-Brownian motion, and for every \( x \in \mathbb{R}^d \) let \( X^x = (X^x_t)_{t \in [0,T]} : [0,T] \times \Omega \to \mathbb{R}^d \) be an \((\mathcal{F}_t)_{t \in [0,T]}\)-adapted stochastic process with continuous sample paths which satisfies that for every \( t \in [0,T] \) it holds \( \mathbb{P}\)-a.s.

\[
X^x_t = x + \int_0^t \mu(X^x_s) \, ds + \int_0^t \sigma(X^x_s) \, dW_s.
\]

The Feynman-Kac formula (cf., for example, Hairer et al. [22, Corollary 4.17 and Remark 4.1]) and (1) hence yield that for every \( x \in \mathbb{R}^d \) it holds that

\[
u(T, x) = \mathbb{E}[u(0, X^x_T)] = \mathbb{E}[\varphi(X^x_T)]. \]
2.3 Formulation as minimization problem

In the next step we exploit (3) to formulate a minimization problem which is uniquely solved by the function \([a,b]^d \ni x \mapsto u(T,x) \in \mathbb{R}\) (cf. (1) above). For this we first recall the \(L^2\)-minimization property of the expectation of a real-valued random variable (see Lemma 2.1 below). Then we extend this minimization result to certain random fields (see Proposition 2.2 below). Thereafter, we apply Proposition 2.2 to random fields in the context of the Feynman-Kac representation (3) to obtain Proposition 2.7 below. Proposition 2.7 provides a minimization problem (see, for instance, (93) below) which has the function \([a,b]^d \ni x \mapsto u(T,x) \in \mathbb{R}\) as the unique global minimizer.

Our proof of Proposition 2.7 is based on the elementary auxiliary results in Lemmas 2.3–2.6. For completeness we also present the proofs of Lemmas 2.3–2.6 here. The statement and the proof of Lemma 2.3 are based on the proof of Da Prato & Zabczyk [13, Lemma 1.1].

**Lemma 2.1.** Let \((\Omega, \mathcal{F}, P)\) be a probability space and let \(X : \Omega \to \mathbb{R}\) be an \(\mathcal{F}/\mathcal{B}(\mathbb{R})\)-measurable random variable which satisfies \(E[|X|^2] < \infty\). Then

(i) it holds for every \(y \in \mathbb{R}\) that
\[
E[|X - y|^2] = E[|X - E[X]|^2] + |E[X] - y|^2,
\]
(ii) it holds that there exists a unique real number \(z \in \mathbb{R}\) such that
\[
E[|X - z|^2] = \inf_{y \in \mathbb{R}} E[|X - y|^2],
\]
and
(iii) it holds that
\[
E[|X - E[X]|^2] = \inf_{y \in \mathbb{R}} E[|X - y|^2].
\]

**Proof of Lemma 2.1.** Observe that the fact that \(E[|X|] < \infty\) ensures that for every \(y \in \mathbb{R}\) it holds that
\[
\]

This establishes item (i). Item (ii) and item (iii) are immediate consequences of item (i). The proof of Lemma 2.1 is thus completed. \(\square\)
Proposition 2.2. Let $a \in \mathbb{R}$, $b \in (a, \infty)$, let $(\Omega, \mathcal{F}, \mathbb{P})$ be a probability space, let $X = (X_x)_{x \in [a,b]^d} : [a,b]^d \times \Omega \to \mathbb{R}$ be a $(\mathcal{B}([a,b]^d) \otimes \mathcal{F})/\mathcal{B}(\mathbb{R})$-measurable function, assume for every $x \in [a,b]^d$ that $\mathbb{E}[|X_x|^2] < \infty$, and assume that the function $[a,b]^d \ni x \mapsto \mathbb{E}[X_x] \in \mathbb{R}$ is continuous. Then

(i) it holds that there exists a unique continuous function $u : [a,b]^d \to \mathbb{R}$ such that

$$\int_{[a,b]^d} \mathbb{E}[|X_x - u(x)|^2] \, dx = \inf_{v \in C([a,b]^d, \mathbb{R})} \left( \int_{[a,b]^d} \mathbb{E}[|X_x - v(x)|^2] \, dx \right)$$

(8)

and

(ii) it holds for every $x \in [a,b]^d$ that $u(x) = \mathbb{E}[X_x]$.

Proof of Proposition 2.2. Observe that item (i) in Lemma 2.1 and the hypothesis that $\forall x \in [a,b]^d : \mathbb{E}[|X_x|^2] < \infty$ ensure that for every function $u : [a,b]^d \to \mathbb{R}$ and every $x \in [a,b]^d$ it holds that

$$\mathbb{E}[|X_x - u(x)|^2] = \mathbb{E}[|X_x - \mathbb{E}[X_x]|^2] + |\mathbb{E}[X_x] - u(x)|^2.$$  

(9)

Fubini’s theorem (see, e.g., Klenke [39, Theorem 14.16]) hence proves that for every continuous function $u : [a,b]^d \to \mathbb{R}$ it holds that

$$\int_{[a,b]^d} \mathbb{E}[|X_x - u(x)|^2] \, dx = \int_{[a,b]^d} \mathbb{E}[|X_x - \mathbb{E}[X_x]|^2] \, dx + \int_{[a,b]^d} |\mathbb{E}[X_x] - u(x)|^2 \, dx.$$  

(10)

The hypothesis that the function $[a,b]^d \ni x \mapsto \mathbb{E}[X_x] \in \mathbb{R}$ is continuous therefore demonstrates that

$$\int_{[a,b]^d} \mathbb{E}[|X_x - \mathbb{E}[X_x]|^2] \, dx$$

$$\geq \inf_{v \in C([a,b]^d, \mathbb{R})} \left( \int_{[a,b]^d} \mathbb{E}[|X_x - v(x)|^2] \, dx \right)$$

$$= \inf_{v \in C([a,b]^d, \mathbb{R})} \left( \int_{[a,b]^d} \mathbb{E}[|X_x - \mathbb{E}[X_x]|^2] \, dx + \int_{[a,b]^d} |\mathbb{E}[X_x] - v(x)|^2 \, dx \right)$$

(11)

$$\geq \inf_{v \in C([a,b]^d, \mathbb{R})} \left( \int_{[a,b]^d} \mathbb{E}[|X_x - \mathbb{E}[X_x]|^2] \, dx \right)$$

$$= \int_{[a,b]^d} \mathbb{E}[|X_x - \mathbb{E}[X_x]|^2] \, dx.$$  

Hence, we obtain that

$$\int_{[a,b]^d} \mathbb{E}[|X_x - \mathbb{E}[X_x]|^2] \, dx = \inf_{v \in C([a,b]^d, \mathbb{R})} \left( \int_{[a,b]^d} \mathbb{E}[|X_x - v(x)|^2] \, dx \right).$$  

(12)
Again the fact that the function \([a, b]^d \ni x \mapsto \mathbb{E}[X_x] \in \mathbb{R}\) is continuous therefore proves that there exists a continuous function \(u: [a, b]^d \to \mathbb{R}\) such that

\[
\int_{[a, b]^d} \mathbb{E}[|X_x - u(x)|^2] \, dx = \inf_{v \in C([a, b]^d, \mathbb{R})} \left( \int_{[a, b]^d} \mathbb{E}[|X_x - v(x)|^2] \, dx \right) \tag{13}
\]

Next observe that (10) and (12) yield that for every continuous function \(u: [a, b]^d \to \mathbb{R}\) with

\[
\int_{[a, b]^d} \mathbb{E}[|X_x - u(x)|^2] \, dx = \inf_{v \in C([a, b]^d, \mathbb{R})} \left( \int_{[a, b]^d} \mathbb{E}[|X_x - v(x)|^2] \, dx \right) \tag{14}
\]

it holds that

\[
\int_{[a, b]^d} \mathbb{E}[|X_x - \mathbb{E}[X_x]|^2] \, dx \\
= \inf_{v \in C([a, b]^d, \mathbb{R})} \left( \int_{[a, b]^d} \mathbb{E}[|X_x - v(x)|^2] \, dx \right) = \int_{[a, b]^d} \mathbb{E}[|X_x - u(x)|^2] \, dx \\
= \int_{[a, b]^d} \mathbb{E}[|X_x - \mathbb{E}[X_x]|^2] \, dx + \int_{[a, b]^d} |\mathbb{E}[X_x] - u(x)|^2 \, dx.
\]

Hence, we obtain that for every continuous function \(u: [a, b]^d \to \mathbb{R}\) with

\[
\int_{[a, b]^d} \mathbb{E}[|X_x - u(x)|^2] \, dx = \inf_{v \in C([a, b]^d, \mathbb{R})} \left( \int_{[a, b]^d} \mathbb{E}[|X_x - v(x)|^2] \, dx \right) \tag{16}
\]

it holds that

\[
\int_{[a, b]^d} |\mathbb{E}[X_x] - u(x)|^2 \, dx = 0. \tag{17}
\]

This and again the hypothesis that the function \([a, b]^d \ni x \mapsto \mathbb{E}[X_x] \in \mathbb{R}\) is continuous yield that for every continuous function \(u: [a, b]^d \to \mathbb{R}\) with

\[
\int_{[a, b]^d} \mathbb{E}[|X_x - u(x)|^2] \, dx = \inf_{v \in C([a, b]^d, \mathbb{R})} \left( \int_{[a, b]^d} \mathbb{E}[|X_x - v(x)|^2] \, dx \right) \tag{18}
\]

and every \(x \in [a, b]^d\) it holds that \(u(x) = \mathbb{E}[X_x]\). Combining this with (13) completes the proof of Proposition 2.2 \(\Box\)

**Lemma 2.3** (Projections in metric spaces). Let \((E, d)\) be a metric space, let \(n \in \mathbb{N}, e_1, e_2, \ldots, e_n \in E\), and let \(P: E \to E\) be the function which satisfies for every \(x \in E\) that

\[
P(x) = e_{\min\{k \in \{1, 2, \ldots, n\} : d(x, e_k) = \min\{d(x, e_1), d(x, e_2), \ldots, d(x, e_n)\}\}}. \tag{19}
\]

Then
(i) it holds for every \(x \in E\) that
\[
d(x, P(x)) = \min_{k \in \{1,2,\ldots,n\}} d(x, e_k)
\] (20)

and

(ii) it holds for every \(A \subseteq E\) that \(P^{-1}(A) \in \mathcal{B}(E)\).

Proof of Lemma 2.3: Throughout this proof let \(D = (D_1, \ldots, D_n) : E \to \mathbb{R}^n\) be the function which satisfies for every \(x \in E\) that
\[
D(x) = (D_1(x), D_2(x), \ldots, D_n(x)) = (d(x, e_1), d(x, e_2), \ldots, d(x, e_n)).
\] (21)

Note that (19) ensures that for every \(k\)
\[
d(x, P(x)) = d(x, e_{\min\{k \in \{1,2,\ldots,n\} : d(x, e_k) = \min\{d(x, e_1), d(x, e_2), \ldots, d(x, e_n)\}\}}) = \min_{k \in \{1,2,\ldots,n\}} d(x, e_k).
\] (22)

This establishes item (i). It thus remains to prove item (ii). For this observe that the fact that the function \(d: E \times E \to [0, \infty)\) is continuous ensures that the function \(D: E \to \mathbb{R}^n\) is continuous. Hence, we obtain that the function \(D: E \to \mathbb{R}^n\) is \(\mathcal{B}(E)/\mathcal{B}(\mathbb{R}^n)\)-measurable. Next note that item (ii) demonstrates that for every \(k \in \{1,2,\ldots,n\}, x \in P^{-1}(\{e_k\})\) it holds that
\[
d(x, e_k) = d(x, P(x)) = \min_{l \in \{1,2,\ldots,n\}} d(x, e_l).
\] (23)

Hence, we obtain that for every \(k \in \{1,2,\ldots,n\}, x \in P^{-1}(\{e_k\})\) it holds that
\[
k \geq \min\{l \in \{1,2,\ldots,n\} : d(x, e_l) = \min\{d(x, e_1), d(x, e_2), \ldots, d(x, e_n)\}\}. \quad (24)
\]

Moreover, note that (19) ensures that for every \(k \in \{1,2,\ldots,n\}, x \in P^{-1}(\{e_k\})\) it holds that
\[
\min\left\{l \in \{1,2,\ldots,n\} : d(x, e_l) = \min_{u \in \{1,2,\ldots,n\}} d(x, e_u)\right\} 
\subseteq \{k, k+1, \ldots, n\}.
\] (25)

Therefore, we obtain that for every \(k \in \{1,2,\ldots,n\}, x \in P^{-1}(\{e_k\})\) with \(e_k \notin (\cup_{l \in \mathbb{N} \setminus \{0,k\}} \{e_l\})\) it holds that
\[
\min\left\{l \in \{1,2,\ldots,n\} : d(x, e_l) = \min_{u \in \{1,2,\ldots,n\}} d(x, e_u)\right\} \geq k.
\] (26)

Combining this with (24) yields that for every \(k \in \{1,2,\ldots,n\}, x \in P^{-1}(\{e_k\})\) with \(e_k \notin (\cup_{l \in \mathbb{N} \setminus \{0,k\}} \{e_l\})\) it holds that
\[
\min\left\{l \in \{1,2,\ldots,n\} : d(x, e_l) = \min_{u \in \{1,2,\ldots,n\}} d(x, e_u)\right\} = k.
\] (27)
Hence, we obtain that for every $k \in \{1, 2, \ldots, n\}$ with $e_k \notin (\cup_{l \in \mathbb{N} \cap [0, k]} \{e_l\})$ it holds that
\[
P^{-1}(\{e_k\}) \subseteq \left\{ x \in E : \min\left\{ l \in \{1, 2, \ldots, n\} : d(x, e_l) = \min_{u \in \{1, 2, \ldots, n\}} d(x, e_u) \right\} = k \right\}. \tag{28}
\]
This and \((19)\) show that for every $k \in \{1, 2, \ldots, n\}$ with $e_k \notin (\cup_{l \in \mathbb{N} \cap [0, k]} \{e_l\})$ it holds that
\[
P^{-1}(\{e_k\}) = \left\{ x \in E : \min\left\{ l \in \{1, 2, \ldots, n\} : d(x, e_l) = \min_{u \in \{1, 2, \ldots, n\}} d(x, e_u) \right\} = k \right\}. \tag{29}
\]
Combining \((21)\) with the fact that the function $D : E \to \mathbb{R}^n$ is $\mathcal{B}(E)/\mathcal{B}(\mathbb{R}^n)$-measurable therefore demonstrates that for every $k \in \{1, 2, \ldots, n\}$ with $e_k \notin (\cup_{l \in \mathbb{N} \cap [0, k]} \{e_l\})$ it holds that
\[
P^{-1}(\{e_k\}) = \left\{ x \in E : \min\left\{ l \in \{1, 2, \ldots, n\} : d(x, e_l) = \min_{u \in \{1, 2, \ldots, n\}} d(x, e_u) \right\} = k \right\}
= \left\{ x \in E : \min\left\{ l \in \{1, 2, \ldots, n\} : D_l(x) = \min_{u \in \{1, 2, \ldots, n\}} D_u(x) \right\} = k \right\}
= \left\{ x \in E : \left( \forall l \in \mathbb{N} \cap [0, k] : D_k(x) < D_l(x) \text{ and } \forall l \in \{1, 2, \ldots, n\} : D_k(x) \leq D_l(x) \right) \right\} \tag{30}
= \left[ \bigcap_{l=1}^{k-1} \left\{ x \in E : D_k(x) < D_l(x) \right\} \right] \bigcap \left[ \bigcap_{l=1}^{n} \left\{ x \in E : D_k(x) \leq D_l(x) \right\} \right] \in \mathcal{B}(E).
\]
Hence, we obtain that for every $f \in \{e_1, e_2, \ldots, e_n\}$ it holds that
\[
P^{-1}(\{f\}) \in \mathcal{B}(E). \tag{31}
\]
Therefore, we obtain that for every $A \subseteq E$ it holds that
\[
P^{-1}(A) = P^{-1}(A \cap \{e_1, e_2, \ldots, e_n\})
= \bigcup_{f \in A \cap \{e_1, e_2, \ldots, e_n\}} P^{-1}(\{f\}) \in \mathcal{B}(E). \tag{32}
\]
This establishes item \(\text{ii}\). The proof of Lemma 2.3 is thus completed. \qed

**Lemma 2.4.** Let $(E, d)$ be a separable metric space, let $(\mathcal{E}, \delta)$ be a metric space, let $(\Omega, \mathcal{F})$ be a measurable space, let $X : E \times \Omega \to \mathcal{E}$ be a function, assume for every $e \in E$ that the function $\Omega \ni \omega \mapsto X(e, \omega) \in \mathcal{E}$ is $\mathcal{F}/\mathcal{B}(\mathcal{E})$-measurable, and assume for every $\omega \in \Omega$ that the function $E \ni e \mapsto X(e, \omega) \in \mathcal{E}$ is continuous. Then it holds that the function $X : E \times \Omega \to \mathcal{E}$ is $(\mathcal{B}(E) \otimes \mathcal{F})/\mathcal{B}(\mathcal{E})$-measurable.
Proof of Lemma 2.4. Throughout this proof let \((e_m)_{m \in \mathbb{N}} \subseteq E\) be a sequence which satisfies that \(\{e_m : m \in \mathbb{N}\} = E\), let \(P_n : E \to E\), \(n \in \mathbb{N}\), be the functions which satisfy for every \(n \in \mathbb{N}\), \(x \in E\) that
\[
P_n(x) = e_{\min\{k \in \{1, 2, \ldots, n\} : d(x, e_k) = \min\{d(x, e_1), d(x, e_2), \ldots, d(x, e_n)\}\},
\]  
and let \(X'_n : E \times \Omega \to \mathcal{E}\), \(n \in \mathbb{N}\), be the functions which satisfy for every \(n \in \mathbb{N}\), \(x \in E\), \(\omega \in \Omega\) that
\[
X'_n(x, \omega) = X(P_n(x), \omega).
\]
Note that (34) shows that for all \(n \in \mathbb{N}\), \(B \in \mathcal{B}(\mathcal{E})\) it holds that
\[
(X'_n)^{-1}(B) = \{(x, \omega) \in E \times \Omega : X'_n(x, \omega) \in B\} = \bigcup_{y \in \text{Im}(P_n)} \left( [(X'_n)^{-1}(B)] \cap [(P_n)^{-1}([y]) \times \Omega] \right)\]
\[
= \bigcup_{y \in \text{Im}(P_n)} \left\{ (x, \omega) \in E \times \Omega : X'_n(x, \omega) \in B \text{ and } x \in (P_n)^{-1}([y]) \right\} \quad (35)
\]
Item (ii) in Lemma 2.3 hence implies that for all \(n \in \mathbb{N}\), \(B \in \mathcal{B}(\mathcal{E})\) it holds that
\[
(X'_n)^{-1}(B) = \bigcup_{y \in \text{Im}(P_n)} \left\{ (x, \omega) \in E \times \Omega : X(y, \omega) \in B \text{ and } x \in (P_n)^{-1}([y]) \right\}
\]
\[
= \bigcup_{y \in \text{Im}(P_n)} \left( [(X(y, \cdot))^{-1}(B)] \cap [(P_n)^{-1}([y]) \times \Omega] \right) \in (\mathcal{B}(E) \otimes \mathcal{F}) \in (\mathcal{B}(E) \otimes \mathcal{F}) \quad (36)
\]
This proves that for every \(n \in \mathbb{N}\) it holds that the function \(X'_n\) is \((\mathcal{B}(E) \otimes \mathcal{F})/\mathcal{B}(\mathcal{E})\)-measurable. In addition, note that item (i) in Lemma 2.3 and the hypothesis that for every \(\omega \in \Omega\) it holds that the function \(E \ni x \mapsto X(x, \omega) \in \mathcal{E}\) is continuous imply that for every \(x \in E\), \(\omega \in \Omega\) it holds that
\[
\lim_{n \to \infty} X'_n(x, \omega) = \lim_{n \to \infty} X(P_n(x), \omega) = X(x, \omega). \quad (37)
\]
Combining this with the fact that for every \(n \in \mathbb{N}\) it holds that the function \(X'_n : E \times \Omega \to \mathcal{E}\) is \((\mathcal{B}(E) \otimes \mathcal{F})/\mathcal{B}(\mathcal{E})\)-measurable shows that the function \(X : E \times \Omega \to \mathcal{E}\) is \((\mathcal{B}(E) \otimes \mathcal{F})/\mathcal{B}(\mathcal{E})\)-measurable. The proof of Lemma 2.4 is thus completed. \(\square\)
Lemma 2.5. Let \((\Omega, \mathcal{F}, \mathbb{P})\) be a probability space, let \((E, d)\) and \((\mathcal{E}, \delta)\) be separable metric spaces, let \(X_n : \Omega \to E, n \in \mathbb{N}_0\), be random variables which satisfy for every \(\varepsilon \in (0, \infty)\) that
\[
\limsup_{n \to \infty} \mathbb{P}(d(X_n, X_0) \geq \varepsilon) = 0,
\]
and let \(\Phi : E \to \mathcal{E}\) be a continuous function. Then it holds for every \(\varepsilon \in (0, \infty)\) that
\[
\limsup_{n \to \infty} \mathbb{P}(\delta(\Phi(X_n), \Phi(X_0)) \geq \varepsilon) = 0.
\]

Proof of Lemma 2.5. Note that (38), e.g., Cox et al. [12, Lemma 2.4], and, e.g., Hutzen-thaler et al. [35, Lemma 4.2] establish (39). The proof of Lemma 2.5 is thus completed. □

Lemma 2.6. Let \(d, m \in \mathbb{N}, T \in (0, \infty), L, a \in \mathbb{R}, b \in (a, \infty)\), let \(\mu : \mathbb{R}^d \to \mathbb{R}^d\) and \(\sigma : \mathbb{R}^d \to \mathbb{R}^{d \times m}\) be functions which satisfy for every \(x, y \in \mathbb{R}^d\) that \(\max\{ \| \mu(x) - \mu(y) \|_{\mathbb{R}^d}, \| \sigma(x) - \sigma(y) \|_{\mathbb{R}^{d \times m}} \} \leq L \| x - y \|_{\mathbb{R}^d}\), let \(\Phi : C([0, T], \mathbb{R}^d) \to \mathbb{R}^d\) be an at most polynomially growing continuous function, let \((\Omega, \mathcal{F}, \mathbb{P})\) be a probability space with a normal filtration \((\mathcal{F}_t)_{t \in [0, T]}\), let \(\xi : \Omega \to [a, b]^d\) be a continuous uniformly distributed \(\mathbb{F}_0/\mathcal{B}([a, b]^d)\)-measurable random variable, let \(W : [0, T] \times \Omega \to \mathbb{R}^m\) be a standard \((\mathcal{F}_t)_{t \in [0, T]}\)-Brownian motion, for every \(x \in [a, b]^d\) let \(X^x = (X^x_t)_{t \in [0, T]} : [0, T] \times \Omega \to \mathbb{R}^d\) be an \((\mathcal{F}_t)_{t \in [0, T]}\)-adapted stochastic process with continuous sample paths which satisfies that for every \(t \in [0, T]\) it holds \(\mathbb{P}\)-a.s. that
\[
X^x_t = x + \int_0^t \mu(X^x_s) \, ds + \int_0^t \sigma(X^x_s) \, dW_s,
\]
and let \(\Xi : [0, T] \times \Omega \to \mathbb{R}^d\) be an \((\mathcal{F}_t)_{t \in [0, T]}\)-adapted stochastic process with continuous sample paths which satisfies that for every \(t \in [0, T]\) it holds \(\mathbb{P}\)-a.s. that
\[
\Xi_t = \xi + \int_0^t \mu(\Xi_s) \, ds + \int_0^t \sigma(\Xi_s) \, dW_s.
\]

Then
(i) it holds for every \(x \in [a, b]^d\) that the functions \(\Omega \ni \omega \mapsto \Phi((X^x_t(\omega))_{t \in [0, T]}) \in \mathbb{R}\) and \(\Omega \ni \omega \mapsto \Phi((\Xi_t(\omega))_{t \in [0, T]}) \in \mathbb{R}\) are \(\mathcal{F}/\mathcal{B}(\mathbb{R})\)-measurable,

(ii) it holds for every \(p \in [2, \infty), x, y \in [a, b]^d\) that
\[
\left( \mathbb{E} \left[ \sup_{t \in [0, T]} \| X^x_t - X^y_t \|_{\mathbb{R}^d} \right]^p \right)^{1/p} \leq \sqrt{2} \exp \left( L^2 T \left[ p + \sqrt{T} \right]^2 \right) \| x - y \|_{\mathbb{R}^d},
\]

(iii) it holds for every \(x \in [a, b]^d\) that \(\mathbb{E} \left[ | \Phi((X^x_t)_{t \in [0, T]}) | + | \Phi((\Xi_t)_{t \in [0, T]}) | \right] < \infty,

(iv) it holds that the function \([a, b]^d \ni x \mapsto \mathbb{E}[\Phi((X^x_t)_{t \in [0, T]})] \in \mathbb{R}\) is continuous, and
(v) it holds that
\[ \mathbb{E} \left[ \Phi((X_t)_{t \in [0,T]}) \right] = \frac{1}{(p - m)^p} \left( \int_{[a,b]^d} \mathbb{E} \left[ \Phi((X^x_t)_{t \in [0,T]}) \right] dx \right). \]  

(43)

Proof of Lemma 2.6. Throughout this proof let \( c \in [1, \infty) \) be a real number which satisfies for every \( w \in C([0,T], \mathbb{R}^m) \) that
\begin{equation}
|\Phi(w)| \leq c \left[ 1 + \sup_{t \in [0,T]} \|w_t\|_R^d \right]^c, \tag{44}
\end{equation}

let \( p_t: C([0,T], \mathbb{R}^m) \rightarrow \mathbb{R}^m, t \in [0,T], \) be the functions which satisfy for every \( t \in [0,T], \)
\( w = (w_s)_{s \in [0,T]} \in C([0,T], \mathbb{R}^m) \) that \( p_t(w) = w_t, \) and let \( \Psi_{x,w}^N: [0,T] \rightarrow \mathbb{R}^d, N \in \mathbb{N}, x \in \mathbb{R}^d, \)
\( w \in C([0,T], \mathbb{R}^m), x \in \mathbb{R}^d, \)
\( N \in \mathbb{N}, n \in \{0, 1, \ldots, N - 1\}, t \in \left[ \frac{nT}{N}, \frac{(n+1)T}{N} \right] \) that \( \Psi_{x,w}^N(0) = x \) and
\begin{equation}
\Psi_{x,w}^N(t) = \Psi_{x,w}^N \left( \frac{nT}{N} \right) + \left( \frac{nT}{N} - n \right) \left[ \mu(\Psi_{x,w}^N \left( \frac{nT}{N} \right)) \frac{T}{N} + \sigma(\Psi_{x,w}^N \left( \frac{nT}{N} \right)) \left( \frac{w(t) - w_T}{T} \right) \right]. \tag{45}
\end{equation}

Observe that the fact that the Borel sigma-algebra \( \mathcal{B}(C([0,T], \mathbb{R}^m)) \) is generated by the set
\( \cup_{t \in [0,T]} \cup_{A \in \mathbb{B}(\mathbb{R}^m)} \{(p_t)^{-1}(A)\} \) (cf., for example, Klenke [39, Theorem 21.31]), the hypothesis that for every \( x \in [a, b]^d \) it holds that \( X^x: [0,T] \times \Omega \rightarrow \mathbb{R}^d \) is an \((\mathcal{F}_t)_{t \in [0,T]}\)-adapted stochastic process with continuous sample paths, and the hypothesis that \( \mathbb{X}: [0,T] \times \Omega \rightarrow \mathbb{R}^d \) is an \((\mathcal{F}_t)_{t \in [0,T]}\)-adapted stochastic process with continuous sample paths demonstrate that the functions
\[ \Omega \ni \omega \mapsto (X^x_t(\omega))_{t \in [0,T]} \in C([0,T], \mathbb{R}^d) \]  

(46)

and
\[ \Omega \ni \omega \mapsto (\mathbb{X}_t(\omega))_{t \in [0,T]} \in C([0,T], \mathbb{R}^d) \]  

(47)

are \( \mathcal{F}/\mathcal{B}(C([0,T], \mathbb{R}^d)) \)-measurable. Combining this with the fact that the function \( \Phi: C([0,T], \mathbb{R}^d) \rightarrow \mathbb{R} \) is \( \mathcal{B}(C([0,T], \mathbb{R}^d))/\mathcal{B}(\mathbb{R}) \)-measurable implies that for every \( x \in [a, b]^d \) it holds that \( \Omega \ni \omega \mapsto \Phi((X^x_t(\omega))_{t \in [0,T]}) \in \mathbb{R} \) and \( \Omega \ni \omega \mapsto \Phi((\mathbb{X}_t(\omega))_{t \in [0,T]}) \in \mathbb{R} \) are \( \mathcal{F}/\mathcal{B}(\mathbb{R}) \)-measurable. This proves item (i). Next observe that (45), the hypothesis that \( \mu: \mathbb{R}^d \rightarrow \mathbb{R}^d \) and \( \sigma: \mathbb{R}^d \rightarrow \mathbb{R}^{d \times m} \) are globally Lipschitz continuous, and the fact that for every \( p \in (0, \infty) \) it holds that \( \mathbb{E}[\|\xi\|_R^p] < \infty \) ensure that for every \( p \in (0, \infty) \) it holds that
\begin{equation}
\sup_{N \in \mathbb{N}} \sup_{x \in [a, b]^d} \left( \mathbb{E} \left[ \sup_{t \in [0,T]} \|\Psi_{x,W}^N(t)\|_R^p \right] + \mathbb{E} \left[ \sup_{t \in [0,T]} \|\Psi_{x,W}^N(t)\|_R^d \right] \right) \leq \sup_{N \in \mathbb{N}} \sup_{x \in [a, b]^d} \left( \mathbb{E} \left[ \max_{n \in \{0, 1, \ldots, N\}} \|\Psi_{x,W}^N(\frac{nT}{N})\|_R^p \right] + \mathbb{E} \left[ \max_{n \in \{0, 1, \ldots, N\}} \|\Psi_{x,W}^N(\frac{nT}{N})\|_R^d \right] \right) < \infty \]  

(48)

12
(cf., for example, Kloeden & Platen [41, Section 10.6]). Next note that (40), (41), (45), the fact that $\mu : \mathbb{R}^d \to \mathbb{R}^d$ and $\sigma : \mathbb{R}^d \to \mathbb{R}^{d \times m}$ are locally Lipschitz continuous functions, and e.g., Hutzenthaler & Jentzen [32, Theorem 3.3] ensure that for every $x \in [a, b]^d$, $\varepsilon \in (0, \infty)$ it holds that

$$\limsup_{N \to \infty} \mathbb{P}\left( \sup_{t \in [0, T]} \| X_t^x - \Psi_{x, W}^N(t) \|_{\mathbb{R}^d} \geq \varepsilon \right) = 0 \quad (49)$$

and

$$\limsup_{N \to \infty} \mathbb{P}\left( \sup_{t \in [0, T]} \| X_t^x - \Psi_{\xi, W}^N(t) \|_{\mathbb{R}^d} \geq \varepsilon \right) = 0. \quad (50)$$

Combining (46), (47), and, e.g., Hutzenthaler & Jentzen [32, Lemma 3.10] hence demonstrates that for every $x \in [a, b]^d$, $p \in (0, \infty)$ it holds that

$$\mathbb{E}\left[ \sup_{t \in [0, T]} \| X_t^x \|^p \right] \leq \liminf_{N \to \infty} \mathbb{E}\left[ \sup_{t \in [0, T]} \| \Psi_{x, W}^N(t) \|^p \right] \leq \sup_{N \in \mathbb{N}} \mathbb{E}\left[ \sup_{t \in [0, T]} \| \Psi_{x, W}^N(t) \|^p \right] \quad (51)$$

and

$$\mathbb{E}\left[ \sup_{t \in [0, T]} \| X_t^\xi \|^p \right] \leq \liminf_{N \to \infty} \mathbb{E}\left[ \sup_{t \in [0, T]} \| \Psi_{\xi, W}^N(t) \|^p \right] \leq \sup_{N \in \mathbb{N}} \mathbb{E}\left[ \sup_{t \in [0, T]} \| \Psi_{\xi, W}^N(t) \|^p \right]. \quad (52)$$

This and (48) assure that for every $p \in (0, \infty)$ it holds that

$$\sup_{x \in [a, b]^d} \left( \mathbb{E}\left[ \sup_{t \in [0, T]} \| X_t^x \|^p \right] + \mathbb{E}\left[ \sup_{t \in [0, T]} \| X_t^\xi \|^p \right] \right) < \infty. \quad (53)$$

Combining (44) and the fact that $\forall r \in (0, \infty)$, $a, b \in \mathbb{R}$: $|a + b|^r \leq 2^r(|a|^r + |b|^r)$ therefore demonstrates that for every $p \in (0, \infty)$ it holds that

$$\sup_{x \in [a, b]^d} \left( \mathbb{E}\left[ |\Phi((X_t^x)_{t \in [0, T]})|^p \right] + \mathbb{E}\left[ |\Phi((X_t^\xi)_{t \in [0, T]})|^p \right] \right) \leq \sup_{x \in [a, b]^d} \left( c^p \mathbb{E}\left[ 1 + \sup_{t \in [0, T]} \| X_t^x \|^p \right] + c^p \mathbb{E}\left[ 1 + \sup_{t \in [0, T]} \| X_t^\xi \|^p \right] \right) \leq 2^{2p} c^p \left( \sup_{x \in [a, b]^d} \mathbb{E}\left[ 2 + \sup_{t \in [0, T]} \| X_t^x \|^p \right] + \sup_{t \in [0, T]} \| X_t^\xi \|^p \right) < \infty. \quad (54)$$
This establishes item (iii). In the next step we observe that (40) ensures that for every \( x, y \in [a, b]^d, t \in [0, T] \) it holds \( \mathbb{P} \)-a.s. that
\[
X_t^x - X_t^y = x - y + \int_0^t (\mu(X_s^x) - \mu(X_s^y)) \, ds + \int_0^t (\sigma(X_s^x) - \sigma(X_s^y)) \, dW_s. \tag{55}
\]
The triangle inequality hence ensures that for every \( x, y \in [a, b]^d, t \in [0, T] \) it holds \( \mathbb{P} \)-a.s. that
\[
\sup_{s \in [0, t]} \| X_s^x - X_s^y \|_{\mathbb{R}^d} \\
\leq \| x - y \|_{\mathbb{R}^d} + \sup_{s \in [0, t]} \int_0^s \| \mu(X_s^x) - \mu(X_s^y) \|_{\mathbb{R}^d} \, dr + \sup_{s \in [0, t]} \left\| \int_0^t (\sigma(X_s^x) - \sigma(X_s^y)) \, dW_r \right\|_{\mathbb{R}^d} \\
\leq \| x - y \|_{\mathbb{R}^d} + L \left[ \sup_{s \in [0, t]} \int_0^s \| X_s^x - X_s^y \|_{\mathbb{R}^d} \, dr \right] + \sup_{s \in [0, t]} \left\| \int_0^t (\sigma(X_s^x) - \sigma(X_s^y)) \, dW_r \right\|_{\mathbb{R}^d} \\
= \| x - y \|_{\mathbb{R}^d} + L \int_0^t \| X_r^x - X_r^y \|_{\mathbb{R}^d} \, dr + \sup_{s \in [0, t]} \left\| \int_0^s (\sigma(X_s^x) - \sigma(X_s^y)) \, dW_r \right\|_{\mathbb{R}^d}. \tag{56}
\]

Therefore, we obtain for every \( p \in [1, \infty) \), \( x, y \in [a, b]^d, t \in [0, T] \) that
\[
\left( \mathbb{E} \left[ \sup_{s \in [0, t]} \| X_s^x - X_s^y \|_{\mathbb{R}^d}^p \right] \right)^{1/p} \leq \| x - y \|_{\mathbb{R}^d} + L \int_0^t \left( \mathbb{E} \left[ \| X_r^x - X_r^y \|_{\mathbb{R}^d}^p \right] \right)^{1/p} \, dr \\
+ \left( \mathbb{E} \left[ \sup_{s \in [0, t]} \left\| \int_0^s (\sigma(X_s^x) - \sigma(X_s^y)) \, dW_r \right\|_{\mathbb{R}^d}^p \right] \right)^{1/p}. \tag{57}
\]
The Burkholder-Davis-Gundy type inequality in Da Prato & Zabczyk [13, Lemma 7.2] hence shows that for every \( p \in [2, \infty) \), \( x, y \in [a, b]^d, t \in [0, T] \) it holds that
\[
\left( \mathbb{E} \left[ \sup_{s \in [0, t]} \| X_s^x - X_s^y \|_{\mathbb{R}^d}^p \right] \right)^{1/p} \leq \| x - y \|_{\mathbb{R}^d} + L \int_0^t \left( \mathbb{E} \left[ \| X_r^x - X_r^y \|_{\mathbb{R}^d}^p \right] \right)^{1/p} \, dr \\
+ \left( \mathbb{E} \left[ \sup_{s \in [0, t]} \left\| \int_0^s (\sigma(X_s^x) - \sigma(X_s^y)) \, dW_r \right\|_{\mathbb{R}^d}^2 \right] \right)^{1/2} \tag{58}
\]
This demonstrates that for every \( p \in [2, \infty) \), \( x, y \in [a, b]^d, t \in [0, T] \) it holds that
\[
\left( \mathbb{E} \left[ \sup_{s \in [0, t]} \| X_s^x - X_s^y \|_{\mathbb{R}^d}^p \right] \right)^{1/p} \leq \| x - y \|_{\mathbb{R}^d} + L \int_0^t \left( \mathbb{E} \left[ \| X_r^x - X_r^y \|_{\mathbb{R}^d}^p \right] \right)^{1/p} \, dr \\
+ Lp \left[ \int_0^t \left( \mathbb{E} \left[ \| X_r^x - X_r^y \|_{\mathbb{R}^d}^2 \right] \right)^{1/2} \, dr \right]^{1/2}. \tag{59}
\]
Hölder’s inequality hence proves that for every $p \in [2, \infty)$, $x, y \in [a, b]^d$, $t \in [0, T]$ it holds that
\[
\left( \mathbb{E} \left[ \sup_{s \in [0, t]} \| X^x_s - X^y_s \|^p_{\mathbb{R}^d} \right] \right)^{1/p} \leq \| x - y \|_{\mathbb{R}^d} + L \sqrt{t} \left[ \mathbb{E} \left[ \| X^x_t - X^y_t \|^p_{\mathbb{R}^d} \right] \right]^{1/2} + Lp \int_0^t \left( \mathbb{E} \left[ \| X^x_r - X^y_r \|^p_{\mathbb{R}^d} \right] \right)^{1/2} dr \\
\leq \| x - y \|_{\mathbb{R}^d} + L \sqrt{t} \left( \mathbb{E} \left[ \| X^x_t - X^y_t \|^p_{\mathbb{R}^d} \right] \right)^{1/2} + Lp \int_0^t \left( \mathbb{E} \left[ \| X^x_r - X^y_r \|^p_{\mathbb{R}^d} \right] \right)^{1/2} dr.
\] (60)

The fact that $\forall v, w \in \mathbb{R} : |v + w|^2 \leq 2v^2 + 2w^2$ therefore shows that for every $p \in [2, \infty)$, $x, y \in [a, b]^d$, $t \in [0, T]$ it holds that
\[
\left( \mathbb{E} \left[ \sup_{s \in [0, t]} \| X^x_s - X^y_s \|^p_{\mathbb{R}^d} \right] \right)^{1/p} \leq 2\| x - y \|_{\mathbb{R}^d}^2 + 2L^2 [p + \sqrt{T}]^2 \int_0^t \left( \mathbb{E} \left[ \| X^x_r - X^y_r \|^p_{\mathbb{R}^d} \right] \right)^{1/2} dr \\
\leq 2\| x - y \|_{\mathbb{R}^d}^2 + 2L^2 [p + \sqrt{T}]^2 \int_0^t \left( \mathbb{E} \left[ \sup_{s \in [0, t]} \| X^x_s - X^y_s \|^p_{\mathbb{R}^d} \right] \right)^{1/2} dr.
\] (61)

Combining the Gronwall inequality (cf., e.g., Andersson et al. [2, Lemma 2.6] (with $\alpha = 0$, $\beta = 0$, $a = 2\| x - y \|_{\mathbb{R}^d}^2$, $b = 3L^2 [p + \sqrt{T}]$, $e = (0, T) \ni t \mapsto \left( \mathbb{E} \left[ \sup_{s \in [0, t]} \| X^x_s - X^y_s \|^p_{\mathbb{R}^d} \right] \right)^{1/2} \in [0, \infty) \right)$ in the notation of Lemma 2.6)) and (53) hence establishes that for every $p \in [2, \infty)$, $x, y \in [a, b]^d$, $t \in [0, T]$ it holds that
\[
\left( \mathbb{E} \left[ \sup_{s \in [0, t]} \| X^x_s - X^y_s \|^p_{\mathbb{R}^d} \right] \right)^{1/p} \leq 2\| x - y \|_{\mathbb{R}^d}^2 \exp \left( 2L^2 t [p + \sqrt{T}]^2 \right).
\] (62)

Therefore, we obtain that for every $p \in [2, \infty)$, $x, y \in [a, b]^d$ it holds that
\[
\left( \mathbb{E} \left[ \sup_{t \in [0, T]} \| X^x_t - X^y_t \|^p \right] \right)^{1/p} \leq \sqrt{2} \exp \left( L^2 T [p + \sqrt{T}]^2 \right) \| x - y \|_{\mathbb{R}^d}.
\] (63)

This establishes item (ii). Next observe that item (ii) and Jensen’s inequality imply that for every $p \in (0, \infty)$ it holds that
\[
\sup_{x,y \in [a,b]^d, x \neq y} \left( \frac{\mathbb{E} \left[ \sup_{t \in [0, T]} \| X^x_t - X^y_t \|^p_{\mathbb{R}^d} \right]^{1/p}}{\| x - y \|_{\mathbb{R}^d}} \right) < \infty.
\] (64)
The hypothesis that the function $\Phi: C([0, T], \mathbb{R}^d) \rightarrow \mathbb{R}$ is continuous and Lemma 2.5 hence ensure that for every $\varepsilon \in (0, \infty)$, $(x_n)_{n \in \mathbb{N}} \subseteq [a, b]^d$ with $\limsup_{n \to \infty} \|x_0 - x_n\|_{\mathbb{R}^d} = 0$ it holds that
\[
\limsup_{n \to \infty} \mathbb{P} \left( |\Phi((X^x_n)_{t \in [0, T]}) - \Phi((X^x_t)_{t \in [0, T]})| \geq \varepsilon \right) = 0. \tag{65}
\]
Combining (54) with, e.g., Hutzenthaler et al. \[35, Proposition 4.5\] therefore implies that for every $(x_n)_{n \in \mathbb{N}} \subseteq [a, b]^d$ with $\limsup_{n \to \infty} \|x_0 - x_n\|_{\mathbb{R}^d} = 0$ it holds that
\[
\limsup_{n \to \infty} \mathbb{E} \left[ |\Phi((X^x_n)_{t \in [0, T]}) - \Phi((X^x_t)_{t \in [0, T]})| \right] = 0. \tag{66}
\]
This establishes item (iv). In the next step we observe that (49) and (50) ensure that for every $\varepsilon \in (0, \infty)$, $x \in [a, b]^d$ it holds that
\[
\limsup_{N \to \infty} \left[ \mathbb{P} \left( \sup_{t \in [0, T]} \|\Psi^N_{x,W}(t) - X^x_t\|_{\mathbb{R}^d} \geq \varepsilon \right) + \mathbb{P} \left( \sup_{t \in [0, T]} \|\Psi^N_{\xi,W}(t) - X^\xi_t\|_{\mathbb{R}^d} \geq \varepsilon \right) \right] = 0. \tag{67}
\]
The hypothesis that the function $\Phi$ is continuous and Lemma 2.5 therefore demonstrate that for every $\varepsilon \in (0, \infty)$, $x \in [a, b]^d$ it holds that
\[
\limsup_{N \to \infty} \left[ \mathbb{P} \left( |\Phi(\Psi^N_{x,W}) - \Phi((X^x_t)_{t \in [0, T]})| + |\Phi(\Psi^N_{\xi,W}) - \Phi((X^\xi_t)_{t \in [0, T]})| \geq \varepsilon \right) \right] = 0. \tag{68}
\]
Next observe that (44) assures that for every $N \in \mathbb{N}$, $x \in [a, b]^d$, $p \in (0, \infty)$ it holds that
\[
\mathbb{E} \left[ |\Phi(\Psi^N_{x,W}) - \Phi((X^x_t)_{t \in [0, T]})|^p + |\Phi(\Psi^N_{\xi,W}) - \Phi((X^\xi_t)_{t \in [0, T]})|^p \right] \\
\leq 2^p \mathbb{E} \left[ |\Phi(\Psi^N_{x,W})|^p + |\Phi((X^x_t)_{t \in [0, T]})|^p \right] + 2^p \mathbb{E} \left[ |\Phi(\Psi^N_{\xi,W})|^p + |\Phi((X^\xi_t)_{t \in [0, T]})|^p \right] \\
\leq 2^p c^p \mathbb{E} \left[ 1 + \sup_{t \in [0, T]} \|\Psi^N_{x,W}(t)\|_{\mathbb{R}^d} \right]^p + 2^p c^p \mathbb{E} \left[ 1 + \sup_{t \in [0, T]} \|X^x_t\|_{\mathbb{R}^d} \right]^p \\
+ 2^p c^p \mathbb{E} \left[ 1 + \sup_{t \in [0, T]} \|\Psi^N_{\xi,W}(t)\|_{\mathbb{R}^d} \right]^p + 2^p c^p \mathbb{E} \left[ 1 + \sup_{t \in [0, T]} \|X^\xi_t\|_{\mathbb{R}^d} \right]^p \tag{69}
\]
Combining (48) and (53) hence shows that for every $p \in (0, \infty)$ it holds that
\[
\sup_{N \in \mathbb{N}} \sup_{x \in [a, b]^d} \left( \mathbb{E} \left[ |\Phi(\Psi^N_{x,W}) - \Phi((X^x_t)_{t \in [0, T]})|^p + |\Phi(\Psi^N_{\xi,W}) - \Phi((X^\xi_t)_{t \in [0, T]})|^p \right] \right) < \infty. \tag{70}
\]
This, (68), and, e.g., Hutzenthaler et al. \[35, Proposition 4.5\] imply that for every $x \in [a, b]^d$ it holds that
\[
\limsup_{N \to \infty} \left( \mathbb{E} \left[ |\Phi(\Psi^N_{x,W}) - \Phi((X^x_t)_{t \in [0, T]})| \right] + \mathbb{E} \left[ |\Phi(\Psi^N_{\xi,W}) - \Phi((X^\xi_t)_{t \in [0, T]})| \right] \right) = 0. \tag{71}
\]
Combining (70) with Lebesgue’s dominated convergence theorem therefore demonstrates that
\[
\limsup_{N \to \infty} \left( \int_{[a,b]^d} \mathbb{E} \left[ |\Phi(\Psi^N_{x,W}) - \Phi(X^T_t)_{t \in [0,T]}| \right] \, dx \right) = 0.
\] (72)

In addition, observe that (69), (48), and (53) prove that for all \( p \in (0, \infty) \) it holds that
\[
\sup_{N \in \mathbb{N}} \sup_{x \in [a,b]^d} \mathbb{E} \left[ |\Phi(\Psi^N_{x,W})|^p \right] < \infty.
\] (73)

Next observe that (71) and the fact that \( \xi \) and \( W \) are independent imply that
\[
\mathbb{E} \left[ \Phi((X_t)_{t \in [0,T]}) \right] = \lim_{N \to \infty} \mathbb{E} \left[ \Phi(\Psi^N_{x,W}) \right]
\] (74)
\[
= \lim_{N \to \infty} \left[ \int_{[a,b]^d \times C([0,T],\mathbb{R}^d)} \Phi(\Psi^N_{x,w}) \left( (\xi, W)(\mathbb{P}) \right) (dx, dw) \right].
\]

Combining Fubini’s theorem, (72), and (73) with Lebesgue’s dominated convergence theorem therefore assures that
\[
\mathbb{E} \left[ \Phi((X_t)_{t \in [0,T]}) \right] = \lim_{N \to \infty} \left[ \int_{[a,b]^d} \left( \int_{C([0,T],\mathbb{R}^d)} \Phi(\Psi^N_{x,w}) (W(\mathbb{P}))(dw) \right) (\xi(\mathbb{P}))(dx) \right]
\] (75)
\[
= \lim_{N \to \infty} \left[ \int_{[a,b]^d} \mathbb{E} \left[ \Phi(\Psi^N_{x,W}) \right] (\xi(\mathbb{P}))(dx) \right]
\]
\[
= \int_{[a,b]^d} \mathbb{E} \left[ \Phi((X^T_t)_{t \in [0,T]}) \right] (\xi(\mathbb{P}))(dx)
\]
\[
= \frac{1}{(b - a)^d} \int_{[a,b]^d} \mathbb{E} \left[ \Phi((X^T_t)_{t \in [0,T]}) \right] \, dx.
\]

This establishes item (v). The proof of Lemma 2.6 is thus completed.

Proposition 2.7. Let \( d, m \in \mathbb{N}, T \in (0, \infty), a \in \mathbb{R}, b \in (a, \infty), \) let \( \mu : \mathbb{R}^d \to \mathbb{R}^d \) and \( \sigma : \mathbb{R}^d \to \mathbb{R}^{d \times m} \) be globally Lipschitz continuous functions, let \( \varphi : \mathbb{R}^d \to \mathbb{R} \) be a function, let \( u = (u(t,x))_{(t,x) \in [0,T] \times \mathbb{R}^d} \in C^{1,2}([0,T] \times \mathbb{R}^d, \mathbb{R}) \) be a function with at most polynomially

17
growing partial derivatives which satisfies for every $t \in [0, T]$, $x \in \mathbb{R}^d$ that $u(0, x) = \varphi(x)$ and

$$
\frac{\partial u}{\partial t}(t, x) = \frac{1}{2} \text{Trace}_{\mathbb{R}^d}(\sigma(x)[\sigma(x)]^* (\text{Hess}_x u)(t, x)) + \langle \mu(x), (\nabla_x u)(t, x) \rangle_{\mathbb{R}^d},
$$

(76)

let $(\Omega, \mathcal{F}, (\mathbb{P})$ be a probability space with a normal filtration $(\mathbb{F}_t)_{t \in [0, T]}$, let $W: [0, T] \times \Omega \to \mathbb{R}^m$ be a standard $(\mathbb{F}_t)_{t \in [0, T]}$-Brownian motion, let $\xi: \Omega \to [a, b]^d$ be a continuous uniformly distributed $\mathbb{F}_0$/$\mathcal{B}([a, b]^d)$-measurable random variable, and let $X = (X_t)_{t \in [0, T]}: [0, T] \times \Omega \to \mathbb{R}^d$ be an $(\mathbb{F}_t)_{t \in [0, T]}$-adapted stochastic process with continuous sample paths which satisfies that for every $t \in [0, T]$ it holds $\mathbb{P}$-a.s. that

$$
X_t = \xi + \int_0^t \mu(X_s) \, ds + \int_0^t \sigma(X_s) \, dW_s.
$$

(77)

Then

(i) it holds that the function $\varphi: \mathbb{R}^d \to \mathbb{R}$ is twice continuously differentiable with at most polynomially growing derivatives,

(ii) it holds that there exists a unique continuous function $U: [a, b]^d \to \mathbb{R}$ such that

$$
\mathbb{E} \left[ |\varphi(X_T) - U(\xi)|^2 \right] = \inf_{v \in C([a, b]^d, \mathbb{R})} \mathbb{E} \left[ |\varphi(X_T) - v(\xi)|^2 \right],
$$

(78)

and

(iii) it holds for every $x \in [a, b]^d$ that $U(x) = u(T, x)$.

Proof of Proposition 2.7. Throughout this proof let $X^x = (X^x_t)_{t \in [0, T]}: [0, T] \times \Omega \to \mathbb{R}^d$, $x \in [a, b]^d$, be $(\mathbb{F}_t)_{t \in [0, T]}$-adapted stochastic processes with continuous sample paths

a) which satisfy that for every $t \in [0, T]$, $x \in [a, b]^d$ it holds $\mathbb{P}$-a.s. that

$$
X^x_t = x + \int_0^t \mu(X^x_s) \, ds + \int_0^t \sigma(X^x_s) \, dW_s
$$

(79)

and

b) which satisfy that for every $\omega \in \Omega$ it holds that the function $[a, b]^d \ni x \mapsto X^x_T(\omega) \in \mathbb{R}^d$ is continuous (cf., for example, Cox et al. [11] Theorem 3.5] and item (iii) in Lemma 2.6).

Note that the assumption that $\forall x \in \mathbb{R}^d: u(0, x) = \varphi(x)$ and the assumption that $u \in C^{1,2}([0, T] \times \mathbb{R}^d, \mathbb{R})$ has at most polynomially growing partial derivatives establish item (i).

Next note that item (i) and the fact that for every $p \in (0, \infty)$, $x \in [a, b]^d$ it holds that

$$
\sup_{t \in [0, T]} \mathbb{E}[|X^x_T|_p^p] < \infty
$$

(80)
assure that for every $x \in [a,b]^d$ it holds that
\[
\mathbb{E}[|\varphi(X_T^x)|^2] < \infty.
\] (81)

Item [i], the assumption that for every $\omega \in \Omega$ it holds that the function $[a,b]^d \ni x \mapsto X_T^x(\omega) \in \mathbb{R}^d$ is continuous, and, e.g., Hutzenthaler et al. [35, Proposition 4.5] hence ensure that the function
\[
[a,b]^d \ni x \mapsto \mathbb{E}[\varphi(X_T^x)] \in \mathbb{R}
\] (82)
is continuous. In the next step we combine the fact that for every $x \in [a,b]^d$ it holds that the function $\Omega \ni \omega \mapsto \varphi(X_T^x(\omega)) \in \mathbb{R}$ is $\mathcal{F}/\mathcal{B}(\mathbb{R})$-measurable, the fact that for every $\omega \in \Omega$ it holds that the function $[a,b]^d \ni x \mapsto \varphi(X_T^x(\omega)) \in \mathbb{R}$ is continuous, and Lemma 2.4 to obtain that the function
\[
[a,b]^d \times \Omega \ni (x,\omega) \mapsto \varphi(X_T^x(\omega)) \in \mathbb{R}
\] (83)
is $(\mathcal{B}([a,b]^d) \otimes \mathcal{F})/\mathcal{B}(\mathbb{R})$-measurable. Combining this, (81), (82), and Proposition 2.2 demonstrates

A) that there exists a unique continuous function $U : [a,b]^d \to \mathbb{R}$ which satisfies that
\[
\int_{[a,b]^d} \mathbb{E}[|\varphi(X_T^x) - U(x)|^2] \, dx = \inf_{v \in C([a,b]^d,\mathbb{R})} \left( \int_{[a,b]^d} \mathbb{E}[|\varphi(X_T^x) - v(x)|^2] \, dx \right)
\] (84)
and
\[
\sup_{x \in [a,b]^d} |U(x)| < \infty.
\] (85)

Next note that for every continuous function $V : [a,b]^d \to \mathbb{R}$ it holds that
\[
\sup_{x \in [a,b]^d} |V(x)| < \infty.
\] (86)

Item [i] hence implies that for every continuous function $V : [a,b]^d \to \mathbb{R}$ it holds that
\[
C([0,T],\mathbb{R}^d) \ni (z_t)_{t \in [0,T]} \mapsto |\varphi(z_T) - V(z_0)|^2 \in \mathbb{R}
\] (87)
is an at most polynomially growing continuous function. Combining Lemma 2.6 (with $\Phi = (C([0,T],\mathbb{R}^d) \ni (z_t)_{t \in [0,T]} \mapsto |\varphi(z_T) - V(z_0)|^2 \in \mathbb{R})$ for $V \in C([a,b]^d,\mathbb{R}^d)$ in the notation of Lemma 2.6, (77), item [i], and (79) hence ensures that for every continuous function $V : [a,b]^d \to \mathbb{R}$ it holds that
\[
\mathbb{E}[|\varphi(X_T^x) - V(x)|^2] = \frac{1}{(b-a)^d} \left[ \int_{[a,b]^d} \mathbb{E}[|\varphi(X_T^x) - V(x)|^2] \, dx \right].
\] (88)
Hence, we obtain that for every continuous function $V: [a, b]^d \to \mathbb{R}$ with $\mathbb{E}[|\varphi(X_T) - V(\xi)|^2] = \inf_{v \in C([a, b]^d, \mathbb{R})} \mathbb{E}[|\varphi(X_T) - v(\xi)|^2]$ it holds that

$$\int_{[a, b]^d} \mathbb{E}[|\varphi(X_T^x) - V(x)|^2] \, dx$$

$$= (b - a)^d \left( \frac{1}{(b - a)^d} \int_{[a, b]^d} \mathbb{E}[|\varphi(X_T^x) - V(x)|^2] \, dx \right)$$

$$= (b - a)^d \left( \mathbb{E}
[\varphi(X_T) - V(\xi)]^2 \right)$$

$$= (b - a)^d \left( \inf_{v \in C([a, b]^d, \mathbb{R})} \mathbb{E}[|\varphi(X_T) - v(\xi)|^2] \right)$$

$$= (b - a)^d \left( \inf_{v \in C([a, b]^d, \mathbb{R})} \left( \frac{1}{(b - a)^d} \int_{[a, b]^d} \mathbb{E}[|\varphi(X_T^x) - v(x)|^2] \, dx \right) \right)$$

$$= \inf_{v \in C([a, b]^d, \mathbb{R})} \left( \int_{[a, b]^d} \mathbb{E}[|\varphi(X_T^x) - v(x)|^2] \, dx \right).$$

Combining this with (88) proves that for every continuous function $V: [a, b]^d \to \mathbb{R}$ with $\mathbb{E}[|\varphi(X_T) - V(\xi)|^2] = \inf_{v \in C([a, b]^d, \mathbb{R})} \mathbb{E}[|\varphi(X_T) - v(\xi)|^2]$ it holds that

$$U = V.$$  \hfill (90)

Next observe that (88) and (84) demonstrate that

$$\mathbb{E}[|\varphi(X_T) - U(\xi)|^2] = \frac{1}{(b - a)^d} \left( \int_{[a, b]^d} \mathbb{E}[|\varphi(X_T^x) - U(x)|^2] \, dx \right)$$

$$= \inf_{v \in C([a, b]^d, \mathbb{R})} \left( \frac{1}{(b - a)^d} \left( \int_{[a, b]^d} \mathbb{E}[|\varphi(X_T^x) - v(x)|^2] \, dx \right) \right)$$

$$= \inf_{v \in C([a, b]^d, \mathbb{R})} \mathbb{E}[|\varphi(X_T) - v(\xi)|^2].$$

Combining this with (90) proves item (ii). Next note that (76), (85), and the Feynman-Kac formula (cf., for example, Hairer et al. [22, Corollary 4.17]) imply that for every $x \in [a, b]^d$ it holds that $U(x) = \mathbb{E}[\varphi(X_T^x)] = u(T, x)$. This establishes item (iii). The proof of Proposition 2.7 is thus completed. \hfill \Box

In the next step we use Proposition 2.7 to obtain a minimization problem which is uniquely solved by the function $[a, b]^d \ni x \mapsto u(T, x) \in \mathbb{R}$. More specifically, let $\xi: \Omega \to [a, b]^d$ be a continuously uniformly distributed $\mathcal{F}_0/B([a, b]^d)$-measurable random variable, and let $X: [0, T] \times \Omega \to \mathbb{R}^d$ be an $(\mathcal{F}_t)_{t \in [0, T]}$-adapted stochastic process with continuous sample paths which satisfies that for every $t \in [0, T]$ it holds $\mathbb{P}$-a.s. that

$$X_t = \xi + \int_0^t \mu(X_s) \, ds + \int_0^t \sigma(X_s) \, dW_s.$$  \hfill (92)
Proposition 2.7 then guarantees that the function \([a, b]^d \ni x \mapsto u(T, x) \in \mathbb{R}\) is the unique global minimizer of the function

\[
C([a, b]^d, \mathbb{R}) \ni v \mapsto \mathbb{E}[|\varphi(X_T) - v(\xi)|^2] \in \mathbb{R}.
\] (93)

In the following two subsections we derive an approximated minimization problem by discretizing the stochastic process \(X: [0, T] \times \Omega \to \mathbb{R}^d\) (see Subsection 2.4 below) and by employing a deep neural network approximation for the function \(\mathbb{R}^d \ni x \mapsto u(T, x) \in \mathbb{R}\) (see Subsection 2.5 below).

### 2.4 Discretization of the stochastic differential equation

In this subsection we use the Euler-Maruyama scheme (cf., for example, Kloeden & Platen [41] and Maruyama [44]) to temporally discretize the solution process \(X\) of the SDE (92).

More specifically, let \(N \in \mathbb{N}\), let \(t_0, t_1, \ldots, t_N \in [0, \infty)\) be real numbers which satisfy

\[
0 = t_0 < t_1 < \ldots < t_N = T.
\] (94)

Note that (92) implies that for every \(n \in \{0, 1, \ldots, N - 1\}\) it holds \(\mathbb{P}\)-a.s. that

\[
X_{t_{n+1}} = X_{t_n} + \int_{t_n}^{t_{n+1}} \mu(X_s) \, ds + \int_{t_n}^{t_{n+1}} \sigma(X_s) \, dW_s.
\] (95)

This suggests that for sufficiently small mesh size \(\sup_{n \in \{0, 1, \ldots, N - 1\}} (t_{n+1} - t_n)\) it holds that

\[
X_{t_{n+1}} \approx X_{t_n} + \mu(X_{t_n}) (t_{n+1} - t_n) + \sigma(X_{t_n}) (W_{t_{n+1}} - W_{t_n}).
\] (96)

Let \(\mathcal{X}: \{0, 1, \ldots, N\} \times \Omega \to \mathbb{R}^d\) be the stochastic process which satisfies for every \(n \in \{0, 1, \ldots, N - 1\}\) that \(\mathcal{X}_0 = \xi\) and

\[
\mathcal{X}_{n+1} = \mathcal{X}_n + \mu(\mathcal{X}_n) (t_{n+1} - t_n) + \sigma(\mathcal{X}_n) (W_{t_{n+1}} - W_{t_n}).
\] (97)

Observe that (96) and (97) suggest, in turn, that for every \(n \in \{0, 1, 2, \ldots, N\}\) it holds that

\[
\mathcal{X}_n \approx X_{t_n}
\] (98)

(cf., for example, Theorem 2.8 below for a strong convergence result for the Euler-Maruyama scheme).

**Theorem 2.8** (Strong convergence rate for the Euler-Maruyama scheme). Let \(T \in (0, \infty)\), \(d \in \mathbb{N}\), \(p \in [2, \infty)\), let \((\Omega, \mathcal{F}, \mathbb{P})\) be a probability space with a normal filtration \((\mathcal{F}_t)_{t \in [0, T]}\), let \(W: [0, T] \times \Omega \to \mathbb{R}^d\) be a standard \((\mathcal{F}_t)_{t \in [0, T]}\)-Brownian motion, let \(\xi: \Omega \to \mathbb{R}^d\) be a random variable which satisfies that \(\mathbb{E}[\|\xi\|_{\mathbb{R}^d}] < \infty\), let \(\mu: \mathbb{R}^d \to \mathbb{R}^d\) and \(\sigma: \mathbb{R}^d \to \mathbb{R}^{d \times d}\) be Lipschitz
continuous functions, let $X: [0, T] \times \Omega \to \mathbb{R}^d$ be an $(\mathcal{F}_t)_{t \in [0, T]}$-adapted stochastic process with continuous sample paths which satisfies that for every $t \in [0, T]$ it holds $\mathbb{P}$-a.s. that

$$X_t = \xi + \int_0^t \mu(X_s) \, ds + \int_0^t \sigma(X_s) \, dW_s,$$

(99)

for every $N \in \mathbb{N}$ let $t_0^N, t_1^N, \ldots, t_N^N \in [0, T]$ be real numbers which satisfy that

$$0 = t_0^N < t_1^N < \ldots < t_N^N = T,$$

(100)

and for every $N \in \mathbb{N}$ let $\mathcal{X}^N: \{0, 1, \ldots, N\} \times \Omega \to \mathbb{R}^d$ be the stochastic process which satisfies for every $n \in \{0, 1, \ldots, N - 1\}$ that $\mathcal{X}^N_0 = \xi_0$ and

$$\mathcal{X}^N_{n+1} = \mathcal{X}^N_n + \mu(\mathcal{X}^N_n)(t_{n+1}^N - t_n^N) + \sigma(\mathcal{X}^N_n)(W_{t_{n+1}^N} - W_{t_n^N}).$$

(101)

Then there exists a real number $C \in (0, \infty)$ such that for every $N \in \mathbb{N}$ it holds that

$$\sup_{n \in \{0, 1, \ldots, N\}} \left( \mathbb{E}\left[ \|X^N - \mathcal{X}^N_n\|^{p}_{\mathbb{R}^d} \right] \right)^{1/p} \leq C \left[ \max_{n \in \{0, 1, \ldots, N - 1\}} |t_{n+1}^N - t_n^N| \right]^{1/2}.$$

(102)

The proof of Theorem 2.4 is well-known in the literature (cf., for instance, Kloeden & Platen [41], Milstein [46], Hofmann, Müller-Gronbach, & Ritter [30], Müller-Gronbach & Ritter [49], and the references mentioned therein).

2.5 Deep artificial neural network approximations

In this subsection we employ suitable approximations for the solution $\mathbb{R}^d \ni x \mapsto u(T, x) \in \mathbb{R}$ of the PDE $\mathcal{P}$ at time $T$.

More specifically, let $\nu \in \mathbb{N}$ and let $U = (U(\theta, x))_{(\theta, x) \in \mathbb{R}^\nu \times \mathbb{R}^d}: \mathbb{R}^\nu \times \mathbb{R}^d \to \mathbb{R}$ be a continuous function. For every suitable $\theta \in \mathbb{R}^\nu$ and every $x \in [a, b]^d$ we think of $U(\theta, x) \in \mathbb{R}$ as an appropriate approximation

$$U(\theta, x) \approx u(T, x)$$

(103)

of $u(T, x)$. We suggest to choose the function $U: \mathbb{R}^\nu \times \mathbb{R}^d \to \mathbb{R}$ as a deep neural network (cf., for example, Bishop [6]). For instance, let $L_d: \mathbb{R}^d \to \mathbb{R}^d$ be the function which satisfies for every $x = (x_1, x_2, \ldots, x_d) \in \mathbb{R}^d$ that

$$L_d(x) = \left( \frac{\exp(x_1)}{\exp(x_1) + 1}, \frac{\exp(x_2)}{\exp(x_2) + 1}, \ldots, \frac{\exp(x_d)}{\exp(x_d) + 1} \right)$$

(104)

(multidimensional version of the standard logistic function), for every $k, l \in \mathbb{N}$, $\nu \in \mathbb{N}_0 = \{0\} \cup \mathbb{N}$, $\theta = (\theta_1, \ldots, \theta_\nu) \in \mathbb{R}^\nu$ with $\nu + l(k + 1) \leq \nu$ let $A_{k,l}^\nu: \mathbb{R}^k \to \mathbb{R}^l$ be the function
which satisfies for every \( x = (x_1, \ldots, x_k) \in \mathbb{R}^k \) that

\[
A_{\theta, d}^{\theta, v}(x) = \begin{pmatrix}
\theta_{v+1} & \theta_{v+2} & \cdots & \theta_{v+k} \\
\theta_{v+k+1} & \theta_{v+k+2} & \cdots & \theta_{v+2k} \\
\vdots & \vdots & \ddots & \vdots \\
\theta_{v+(l-1)k+1} & \theta_{v+(l-1)k+2} & \cdots & \theta_{v+lk}
\end{pmatrix}
\begin{pmatrix}
x_1 \\
x_2 \\
\vdots \\
x_k
\end{pmatrix} + \begin{pmatrix}
\theta_{v+kl+1} \\
\theta_{v+kl+2} \\
\vdots \\
\theta_{v+kl+l}
\end{pmatrix},
\tag{105}
\]

let \( s \in \{3, 4, 5, 6, \ldots \} \), assume that \((s-1)d(d+1) + d + 1 \leq \nu\), and let \( U: \mathbb{R}^\nu \times \mathbb{R}^d \to \mathbb{R} \) be the function which satisfies for every \( \theta \in \mathbb{R}^\nu \), \( x \in \mathbb{R}^d \) that

\[
U(\theta, x) = (A_{d,1}^{\theta,(s-1)d(d+1)} \circ L_d \circ A_{d,d}^{\theta,(s-2)d(d+1)} \circ \cdots \circ L_d \circ A_{d,d}^{\theta,d(d+1)} \circ L_d \circ A_{d,d}^{\theta,0})(x).
\tag{106}
\]

The function \( U: \mathbb{R}^\nu \times \mathbb{R}^d \to \mathbb{R} \) in \( \text{[106]} \) describes an artificial neural network with \( s+1 \) layers (1 input layer with \( d \) neurons, \( s-1 \) hidden layers with \( d \) neurons each, and 1 output layer with \( d \) neurons) and standard logistic functions as activation functions (cf., for instance, Bishop \[6\]).

### 2.6 Stochastic gradient descent-type minimization

As described in Subsection \[2.5\] for every suitable \( \theta \in \mathbb{R}^\nu \) and every \( x \in [a, b]^d \) we think of \( U(\theta, x) \in \mathbb{R} \) as an appropriate approximation of \( u(T, x) \in \mathbb{R} \). In this subsection we intend to find a suitable \( \theta \in \mathbb{R}^\nu \) as an approximate minimizer of the function

\[
\mathbb{R}^\nu \ni \theta \mapsto \mathbb{E}[|\varphi(\mathcal{X}_N) - U(\theta, \xi)|^2] \in \mathbb{R}.
\tag{107}
\]

To be more specific, we intend to find an approximate minimizer of the function in \( \text{[107]} \) through a stochastic gradient descent-type minimization algorithm (cf., for instance, Ruder \[53\] Section 4), Jentzen et al. \[37\], and the references mentioned therein). For this we approximate the derivative of the function in \( \text{[107]} \) by means of the Monte Carlo method.

More precisely, let \( \xi^{(m)}: \Omega \to [a, b]^d \), \( m \in \mathbb{N}_0 \), be independent continuously uniformly distributed \( \mathbb{F}_0 / \mathcal{B}([a, b]^d) \)-measurable random variables, let \( W^{(m)} : [0, T] \times \Omega \to \mathbb{R}^d \), \( m \in \mathbb{N}_0 \), be independent standard \( \mathbb{F}_t \)-Brownian motions, for every \( m \in \mathbb{N}_0 \) let \( \mathcal{X}^{(m)} = (\mathcal{X}^{(m)}_n)_{n \in \{0, 1, \ldots, N\}}: \{0, 1, \ldots, N\} \times \Omega \to \mathbb{R}^d \) be the stochastic process which satisfies for every \( n \in \{0, 1, \ldots, N-1\} \) that

\[
\mathcal{X}^{(m)}_{n+1} = \mathcal{X}^{(m)}_n + \mu(\mathcal{X}^{(m)}_n) \left( t_{n+1} - t_n \right) + \sigma(\mathcal{X}^{(m)}_n) \left( W^{(m)}_{t_{n+1}} - W^{(m)}_{t_n} \right),
\tag{108}
\]

let \( \gamma \in (0, \infty) \), and let \( \Theta: \mathbb{N}_0 \times \Omega \to \mathbb{R}^\nu \) be a stochastic process which satisfies for every \( m \in \mathbb{N}_0 \) that

\[
\Theta_{m+1} = \Theta_m - 2\gamma \cdot \left( U(\Theta_m, \xi^{(m)}) - \varphi(\mathcal{X}^{(m)}_N) \right) \cdot (\nabla \varphi)(\Theta_m, \xi^{(m)}).
\tag{109}
\]
Under appropriate hypotheses we think for every sufficiently large \( m \in \mathbb{N} \) of the random variable \( \Theta_m: \Omega \to \mathbb{R}^\nu \) as a suitable approximation of a local minimum point of the function \( f \) and we think for every sufficiently large \( m \in \mathbb{N} \) of the random function \( [a, b]^d \ni x \mapsto u(\Theta_n, x) \in \mathbb{R} \) as a suitable approximation of the function \( [a, b]^d \ni x \mapsto u(T, x) \in \mathbb{R} \).

2.7 Description of the algorithm in a special case

In this subsection we give a description of the proposed approximation method in a special case, that is, we describe the proposed approximation method in the specific case where a particular neural network approximation is chosen and where the plain-vanilla stochastic gradient descent method with a constant learning rate is the employed stochastic minimization algorithm (cf. (109) above). For a more general description of the proposed approximation method we refer the reader to Subsection 2.8 below.

**Framework 2.9.** Let \( T, \gamma \in (0, \infty), a \in \mathbb{R}, b \in (a, \infty), d, N \in \mathbb{N}, s \in \{3, 4, 5, \ldots \}, \) let \( \nu = sd(d + 1) \), let \( t_0, t_1, \ldots, t_N \in [0, T] \) be real numbers with

\[
0 = t_0 < t_1 < \ldots < t_N = T, \quad (110)
\]

let \( \mu: \mathbb{R}^d \to \mathbb{R}^d \) and \( \sigma: \mathbb{R}^d \to \mathbb{R}^{d \times d} \) be continuous functions, let \( (\Omega, \mathcal{F}, \mathbb{P}, (\mathbb{F}_t)_{t \in [0, T]}) \) be a filtered probability space, let \( \xi^{(m)}: \Omega \to [a, b]^d, m \in \mathbb{N}_0 \), be independent continuously uniformly distributed \( \mathbb{F}_0/\mathcal{B}([a, b]^d) \)-measurable random variables, let \( W^{(m)}: [0, T] \times \Omega \to \mathbb{R}^d, m \in \mathbb{N}_0 \), be i.i.d. standard \( (\mathbb{F}_t)_{t \in [0, T]} \)-Brownian motions, for every \( m \in \mathbb{N}_0 \) let \( \mathcal{X}^{(m)}: \{0, 1, \ldots, N\} \times \Omega \to \mathbb{R}^d \) be the stochastic process which satisfies for every \( n \in \{0, 1, \ldots, N - 1\} \) that

\[
\mathcal{X}^{(m)}_{n+1} = \mathcal{X}^{(m)}_n + \mu(\mathcal{X}^{(m)}_n) (t_{n+1} - t_n) + \sigma(\mathcal{X}^{(m)}_n) (W^{(m)}_{t_{n+1}} - W^{(m)}_{t_n}), \quad (111)
\]

let \( \mathcal{L}_d: \mathbb{R}^d \to \mathbb{R}^d \) be the function which satisfies for every \( x = (x_1, x_2, \ldots, x_d) \in \mathbb{R}^d \) that

\[
\mathcal{L}_d(x) = \left( \frac{\exp(x_1)}{\exp(x_1) + 1}, \frac{\exp(x_2)}{\exp(x_2) + 1}, \ldots, \frac{\exp(x_d)}{\exp(x_d) + 1} \right), \quad (112)
\]

for every \( k, l \in \mathbb{N}, v \in \mathbb{N}_0 = \{0\} \cup \mathbb{N}, \theta = (\theta_1, \ldots, \theta_v) \in \mathbb{R}^v \) with \( v + l(k + 1) \leq \nu \) let \( A^\theta_{k,l}: \mathbb{R}^k \to \mathbb{R}^l \) be the function which satisfies for every \( x = (x_1, \ldots, x_k) \in \mathbb{R}^k \) that

\[
A^\theta_{k,l}(x) = \begin{pmatrix} \theta_{v+1} & \theta_{v+2} & \cdots & \theta_{v+k} \\ \theta_{v+k+1} & \theta_{v+k+2} & \cdots & \theta_{v+2k} \\ \theta_{v+2k+1} & \theta_{v+2k+2} & \cdots & \theta_{v+3k} \\ \vdots & \vdots & \ddots & \vdots \\ \theta_{v+(l-1)k+1} & \theta_{v+(l-1)k+2} & \cdots & \theta_{v+lk} \end{pmatrix} \begin{pmatrix} x_1 \\ x_2 \\ x_3 \\ \vdots \\ x_k \end{pmatrix} + \begin{pmatrix} \theta_{v+kl+1} \\ \theta_{v+kl+2} \\ \theta_{v+kl+3} \\ \vdots \\ \theta_{v+kl+l} \end{pmatrix}, \quad (113)
\]
let $U: \mathbb{R}^n \times \mathbb{R}^d \to \mathbb{R}$ be the function which satisfies for every $\theta \in \mathbb{R}^n$, $x \in \mathbb{R}^d$ that
\[
U(\theta, x) = \left(A_{d,1}^{\theta,(s-1)(d+1)} \circ \mathcal{L}_d \circ A_{d,d}^{\theta,(s-2)(d+1)} \circ \ldots \circ \mathcal{L}_d \circ A_{d,d}^{\theta,d(d+1)} \circ \mathcal{L}_d \circ A_{d,d}^{\theta,0}\right)(x),
\]
and let $\Theta: \mathbb{N}_0 \times \Omega \to \mathbb{R}^n$ be a stochastic process which satisfies for every $m \in \mathbb{N}_0$ that
\[
\Theta_{m+1} = \Theta_m - 2\gamma \cdot \left(U(\Theta_m, \xi^{(m)}) - \varphi(\mathcal{X}_N^{(m)}) \right) \cdot (\nabla_U)(\Theta_m, \xi^{(m)})
\]
Under appropriate hypotheses we think for every sufficiently large $m \in \mathbb{N}$ and every $x \in [a, b]^d$ of the random variable $U(\Theta_m, x): \Omega \to \mathbb{R}$ in Framework 2.9 as a suitable approximation $U(\Theta_m, x) \approx u(T, x)$ of $u(T, x) \in \mathbb{R}$ where $u = u(t, x)_{(t, x) \in [0, T] \times \mathbb{R}^d}$ is a function with at most polynomially growing partial derivatives which satisfies for every $t \in [0, T]$, $x \in \mathbb{R}^d$ that $u(0, x) = \varphi(x)$ and
\[
\frac{\partial u}{\partial t}(t, x) = \frac{1}{2} \text{Trace}_{\mathbb{R}^d} \left(\sigma(x) [\sigma(x)]^T (\text{Hess}_x u)(t, x) \right) + \langle \mu(x), (\nabla u)(t, x) \rangle_{\mathbb{R}^d}
\]

\section{2.8 Description of the algorithm in the general case}

In this subsection we provide a general framework which covers the approximation method derived in Subsections 2.4.2.6 above and which allows, in addition, to incorporate other minimization algorithms (cf., for example, Kingma & Ba [38], Ruder [53], E et al. [14], Han et al. [24], and Beck et al. [3]) than just the plain vanilla stochastic gradient descent method. The proposed approximation algorithm is an extension of the approximation algorithm in E et al. [14], Han et al. [24], and Beck et al. [3] in the special case of linear Kolmogorov partial differential equations.

\textbf{Framework 2.10.} Let $T \in (0, \infty)$, $N, d, q, \nu, \varsigma \in \mathbb{N}$, let $H: [0, T]^2 \times \mathbb{R}^d \times \mathbb{R}^d \to \mathbb{R}^d$, $\varphi: \mathbb{R}^d \to \mathbb{R}$ be functions, let $(\Omega, \mathcal{F}, \mathbb{P}, (\mathcal{F}_t)_{t \in [0, T]})$ be a filtered probability space, let $W^{m,j}: [0, T] \times \Omega \to \mathbb{R}^d$, $m \in \mathbb{N}_0$, $j \in \mathbb{N}$, be independent standard $([0, T] \times \mathcal{F})$-Brownian motions on $(\Omega, \mathcal{F}, \mathbb{P})$, let $\xi^{m,j}: \Omega \to \mathbb{R}^d$, $m \in \mathbb{N}_0$, $j \in \mathbb{N}$, be i.i.d. $\mathbb{F}_0/\mathcal{B}(\mathbb{R}^d)$-measurable random variables, let $t_0, t_1, \ldots, t_N \in [0, T]$ be real numbers with $0 = t_0 < t_1 < \ldots < t_N = T$, for every $\theta \in \mathbb{R}^n$, $j \in \mathbb{N}$, $s \in \mathbb{R}^c$ let $U^{\theta,j,s}: \mathbb{R}^d \to \mathbb{R}$ be a function, for every $m \in \mathbb{N}_0$, $j \in \mathbb{N}$ for every $n \in \{0, 1, \ldots, N - 1\}$ that $\mathcal{X}_0^{m,j} = \xi^{m,j}$ and
\[
\mathcal{X}_n^{m,j} = H(t_n, t_{n+1}, \mathcal{X}_{n+1}^{m,j}, W_{t_{n+1}}^{m,j} - W_{t_n}^{m,j}),
\]
let $(J_m)_{m \in \mathbb{N}_0} \subseteq \mathbb{N}$ be a sequence, for every $m \in \mathbb{N}_0$, $s \in \mathbb{R}^c$ let $\phi^{m,s}: \mathbb{R}^n \times \Omega \to \mathbb{R}$ be the function which satisfies for every $(\theta, \omega) \in \mathbb{R}^n \times \Omega$ that
\[
\phi^{m,s}(\theta, \omega) = \frac{1}{J_m} \sum_{j=1}^{J_m} \left[U^{\theta,j,s}(\xi^{m,j}(\omega)) - \varphi\left(\mathcal{X}_N^{m,j}(\omega)\right)\right]^2,
\]
for every \( m \in \mathbb{N}_0 \), \( s \in \mathbb{R}^c \) let \( \Psi^{m,s}: \mathbb{R}^c \times \Omega \rightarrow \mathbb{R}^\nu \) be a function which satisfies for every \( \omega \in \Omega \), \( \theta \in \{ \eta \in \mathbb{R}^\nu: \phi^{m,s}(\cdot, \omega): \mathbb{R}^\nu \rightarrow \mathbb{R} \) is differentiable at \( \eta \} \) that
\[
\Psi^{m,s}(\theta, \omega) = (\nabla \theta \phi^{m,s})(\theta, \omega), \tag{119}
\]

let \( \mathcal{S}: \mathbb{R}^c \times \mathbb{R}^\nu \times (\mathbb{R}^d)^N \rightarrow \mathbb{R}^c \) be a function, for every \( m \in \mathbb{N}_0 \) let \( \Phi_m: \mathbb{R}^e \rightarrow \mathbb{R}^e \) and \( \Psi_m: \mathbb{R}^e \times \mathbb{R}^e \rightarrow \mathbb{R}^e \) be functions, let \( \Theta: \mathbb{N}_0 \times \Omega \rightarrow \mathbb{R}^\nu \), \( S: \mathbb{N}_0 \times \Omega \rightarrow \mathbb{R}^c \), and \( \Xi: \mathbb{N}_0 \times \Omega \rightarrow \mathbb{R}^e \) be stochastic processes which satisfy for every \( m \in \mathbb{N}_0 \) that
\[
S_{m+1} = \mathcal{S}(S_m, \Theta_m, (X^m_{i,N})_{i \in \mathbb{N}}), \quad \Xi_{m+1} = \Psi_m(\Xi_m, \Psi^{m,S_{m+1}}(\Theta_m)), \tag{120}
\]
and
\[
\Theta_{m+1} = \Theta_m - \Phi_m(\Xi_{m+1}). \tag{121}
\]

Under appropriate hypotheses we think for every sufficiently large \( m \in \mathbb{N} \) and every \( x \in [a,b]^d \) of the random variable \( U^{\Theta_m,1, \mathbb{N}}(x): \Omega \rightarrow \mathbb{R} \) in Framework 2.10 as a suitable approximation \( U^{\Theta_m,1, \mathbb{N}}(x) \approx u(T,x) \) of \( u(T,x) \in \mathbb{R} \) where \( u = u(t,x)_{(t,x) \in [0,T] \times \mathbb{R}^d} \in C^{1,2}([0,T] \times \mathbb{R}^d, \mathbb{R}) \) is a function with at most polynomially growing partial derivatives which satisfies for every \( t \in [0,T] \), \( x \in \mathbb{R}^d \) that \( u(0,x) = \varphi(x) \) and
\[
\frac{\partial u}{\partial t}(t,x) = \frac{1}{2} \text{Trace}_{\mathbb{R}^d}(\sigma(x)[\sigma(x)]^\top(\text{Hess}_x u)(t,x)) + \langle \mu(x), (\nabla_x u)(t,x) \rangle_{\mathbb{R}^d}, \tag{122}
\]
where \( \mu: \mathbb{R}^d \rightarrow \mathbb{R}^d \) and \( \sigma: \mathbb{R}^d \rightarrow \mathbb{R}^{d \times d} \) are sufficiently regular functions (cf. (1) above).

### 3 Examples

In this section we test the proposed approximation algorithm (see Section 2 above) in the case of several examples of SDEs and Kolmogorov PDEs, respectively. In particular, in this section we apply the proposed approximation algorithm to the heat equation (cf. Subsection 3.2 below), to independent geometric Brownian motions (cf. Subsection 3.3 below), to the Black-Scholes model (cf. Subsection 3.4 below), to stochastic Lorenz equations (cf. Subsection 3.5 below), and to the Heston model (cf. Subsection 3.6 below). In the case of each of the examples below we employ the general approximation algorithm in Framework 2.10 above in conjunction with the Adam optimizer (cf. Kingma & Ba 38) with mini-batches of size 8192 in each iteration step (see Subsection 3.1 below for a precise description). Moreover, we employ a fully-connected feedforward neural network with one input layer, two hidden layers, and one one-dimensional output layer in our implementations in the case of each of these examples. We also use batch normalization (cf. Ioffe & Szegedy 39) just before the first linear transformation, just before each of the two nonlinear activation functions in front of the hidden layers as well as just after the last linear transformation. For the two nonlinear activation functions we employ the multidimensional version of the function \( \mathbb{R} \ni x \mapsto \tanh(x) \in (-1,1) \). All weights in the neural network are initialized by means of the Xavier initialization (cf. Glorot & Bengio 18). All computations were
performed in single precision (float32) on a NVIDIA GeForce GTX 1080 GPU with 1974 MHz core clock and 8 GB GDDR5X memory with 1809.5 MHz clock rate. The underlying system consisted of an Intel Core i7-6800K CPU with 64 GB DDR4-2133 memory running Tensorflow 1.5 on Ubuntu 16.04.

### 3.1 Setting

**Framework 3.1. Assume Framework 2.10,** let $\epsilon = 10^{-8}$, $\beta_1 = 0.9$, $\beta_2 = \frac{999}{1000}$, $(\gamma_m)_{m \in \mathbb{N}_0} \subseteq (0, \infty)$, let $\text{Pow}_r : \mathbb{R}^r \to \mathbb{R}^r$, $r \in (0, \infty)$, be the functions which satisfy for every $r \in (0, \infty)$, $x = (x_1, \ldots, x_r) \in \mathbb{R}^r$ that

$$\text{Pow}_r(x) = (|x_1|^r, \ldots, |x_r|^r),$$

(123)

assume for every $m \in \mathbb{N}_0$, $i \in \{0, 1, \ldots, N\}$ that $J_m = 8192$, $t_i = \frac{iT}{N}$, $v = 2\nu$, $T = 1$, $\gamma_m = 10^{-3}1_{[0,250000]}(m) + 10^{-4}1_{[250000,500000]}(m) + 10^{-5}1_{(500000,\infty)}(m)$, assume for every $m \in \mathbb{N}_0$, $x = (x_1, \ldots, x_r)$, $y = (y_1, \ldots, y_r)$, $\eta = (\eta_1, \ldots, \eta_r) \in \mathbb{R}^r$ that

$$\Psi_m(x, y, \eta) = (\beta_1 x + (1 - \beta_1)\eta, \beta_2 y + (1 - \beta_2)\text{Pow}_2(\eta))$$

(124)

and

$$\psi_m(x, y) = \left(\prod_{i=1}^r \left[\frac{\sqrt{\frac{|y_i|}{1 - (\beta_2)^m}} + \epsilon}{1 - (\beta_1)^m}\right]^{\gamma_m x_i} \prod_{i=1}^r \left[\frac{\sqrt{\frac{|y_i|}{1 - (\beta_2)^m}} + \epsilon}{1 - (\beta_1)^m}\right]^{\gamma_m x_i} \prod_{i=1}^r \left[\frac{\sqrt{\frac{|y_i|}{1 - (\beta_2)^m}} + \epsilon}{1 - (\beta_1)^m}\right]^{\gamma_m x_i}\right)$$

(125)

Equations (124) and (125) in Framework 3.1 describe the Adam optimizer (cf. Kingma & Ba [38], e.g., E et al. [24], (32)–(33) in Section 4.2 and (90)–(91) in Section 5.2), and line 84 in Python code [1] in Section 4 below.

### 3.2 Heat equation

In this subsection we apply the proposed approximation algorithm to the heat equation (see (126) below).

Assume Framework 2.10, assume for every $s, t \in [0, T]$, $x, w \in \mathbb{R}^d$, $m \in \mathbb{N}_0$ that $N = 1$, $d = 100$, $v = d(2d) + (2d)^2 + 2d = 2d(3d + 1)$, $\varphi(x) = \|x\|_{\mathbb{R}^d}^2$, $H(s, t, x, w) = x + \sqrt{2}I_{\mathbb{R}^d}$, $w$, assume that $\xi^{0,1} : \Omega \to \mathbb{R}^d$ is continuous uniformly distributed on $[0, 1]^d$, and let $u = (u(t, x))_{(t, x) \in [0, T] \times \mathbb{R}^d} \in C^{1,2}([0, T] \times \mathbb{R}^d, \mathbb{R})$ be an at most polynomially growing function which satisfies for every $t \in [0, T]$, $x \in \mathbb{R}^d$ that $u(0, x) = \varphi(x)$ and

$$\frac{\partial u}{\partial t}(t, x) = (\Delta_x u)(t, x).$$

(126)

Combining, e.g., Lemma 3.2 below with, e.g., Hairer et al. [22], Corollary 4.17 and Remark 4.1] shows that for every $t \in [0, T]$, $x \in \mathbb{R}^d$ it holds that

$$u(t, x) = \|x\|_{\mathbb{R}^d}^2 + t d.$$

(127)
Table 1 approximately presents the relative $L^1(\lambda_{[0,1]^d}; \mathbb{R})$-approximation error associated to $(\mathcal{U}^\theta_{m,1,S_m}(x))_{x \in [0,1]^d}$ (see (128) below), the relative $L^2(\lambda_{[0,1]^d}; \mathbb{R})$-approximation error associated to $(\mathcal{U}^\theta_{m,1,S_m}(x))_{x \in [0,1]^d}$ (see (129) below), and the relative $L^\infty(\lambda_{[0,1]^d}; \mathbb{R})$-approximation error associated to $(\mathcal{U}^\theta_{m,1,S_m}(x))_{x \in [0,1]^d}$ (see (130) below) against $m \in \{0, 10000, 50000, 100000, 150000, 200000, 500000, 750000\}$ (cf. PYTHON code 2 in Subsection 4.2 below). Figure 1 approximately depicts the relative $L^1(\lambda_{[0,1]^d}; \mathbb{R})$-approximation error associated to $(\mathcal{U}^\theta_{m,1,S_m}(x))_{x \in [0,1]^d}$ (see (128) below), the relative $L^2(\lambda_{[0,1]^d}; \mathbb{R})$-approximation error associated to $(\mathcal{U}^\theta_{m,1,S_m}(x))_{x \in [0,1]^d}$ (see (129) below), and the relative $L^\infty(\lambda_{[0,1]^d}; \mathbb{R})$-approximation error associated to $(\mathcal{U}^\theta_{m,1,S_m}(x))_{x \in [0,1]^d}$ (see (130) below) against $m \in \{0, 100, 200, 300, \ldots, 299800, 299900, 300000\}$ (cf. PYTHON code 2 in Subsection 4.2 below). In our numerical simulations for Table 1 and Figure 1 we calculated the exact solution of the PDE (126) by means of Lemma 3.2 below (see (127) above), we approximately calculated the relative $L^1(\lambda_{[0,1]^d}; \mathbb{R})$-approximation error

$$\int_{[0,1]^d} \frac{|u(T,x) - \mathcal{U}^\theta_{m,1,S_m}(x)|}{u(T,x)} \, dx$$

(128)

for $m \in \{0, 10000, 50000, 100000, 150000, 200000, 500000, 750000\}$ by means of Monte Carlo approximations with 10240000 samples, we approximately calculated the relative $L^2(\lambda_{[0,1]^d}; \mathbb{R})$-approximation error

$$\sqrt{\int_{[0,1]^d} \frac{|u(T,x) - \mathcal{U}^\theta_{m,1,S_m}(x)|^2}{u(T,x)} \, dx}$$

(129)

for $m \in \{0, 10000, 50000, 100000, 150000, 200000, 500000, 750000\}$ by means of Monte Carlo approximations with 10240000 samples, and we approximately calculated the relative $L^\infty(\lambda_{[0,1]^d}; \mathbb{R})$-approximation error

$$\sup_{x \in [0,1]^d} \frac{|u(T,x) - \mathcal{U}^\theta_{m,1,S_m}(x)|}{u(T,x)}$$

(130)

for $m \in \{0, 10000, 50000, 100000, 150000, 200000, 500000, 750000\}$ by means of Monte Carlo approximations with 10240000 samples (see Lemma 3.5 below). Table 2 approximately presents the relative $L^1(\mathbb{P}; L^1(\lambda_{[0,1]^d}; \mathbb{R}))$-approximation error associated to $(\mathcal{U}^\theta_{m,1,S_m}(x))_{x \in [0,1]^d}$ (see (131) below), the relative $L^2(\mathbb{P}; L^2(\lambda_{[0,1]^d}; \mathbb{R}))$-approximation error associated to $(\mathcal{U}^\theta_{m,1,S_m}(x))_{x \in [0,1]^d}$ (see (132) below), and the relative $L^\infty(\mathbb{P}; L^\infty(\lambda_{[0,1]^d}; \mathbb{R}))$-approximation error associated to $(\mathcal{U}^\theta_{m,1,S_m}(x))_{x \in [0,1]^d}$ (see (133) below) against $m \in \{0, 10000, 50000, 100000, 150000, 200000, 500000, 750000\}$ (cf. PYTHON code 2 in Subsection 4.2 below). In our numerical simulations for Table 2 we calculated the exact solution of the PDE (126) by means of Lemma 3.2 below (see (127) above), we approximately calculated the relative $L^1(\mathbb{P}; L^1(\lambda_{[0,1]^d}; \mathbb{R}))$-approximation error

$$\mathbb{E} \left[ \int_{[0,1]^d} \frac{|u(T,x) - \mathcal{U}^\theta_{m,1,S_m}(x)|}{u(T,x)} \, dx \right]$$

(131)
for \( m \in \{0, 10000, 50000, 100000, 150000, 200000, 500000, 750000\} \) by means of Monte Carlo approximations with 10240000 samples for the Lebesgue integral and 5 samples for the expectation, we approximately calculated the relative \( L^2(\mathbb{P}; L^2(\lambda_{\{0,1\}}; \mathbb{R})) \)-approximation error

\[
\left( E \left[ \int_{\{0,1\}^d} \left| \frac{u(T, x) - \mathbb{U}^{\Theta_m,1,S_m}(x)}{u(T, x)} \right|^2 dx \right] \right)^{1/2}
\]

(132)

for \( m \in \{0, 10000, 50000, 100000, 150000, 200000, 500000, 750000\} \) by means of Monte Carlo approximations with 10240000 samples for the Lebesgue integral and 5 samples for the expectation, and we approximately calculated the relative \( L^2(\mathbb{P}; L^\infty(\lambda_{\{0,1\}}; \mathbb{R})) \)-approximation error

\[
\left( E \left[ \sup_{x \in \{0,1\}^d} \left| \frac{u(T, x) - \mathbb{U}^{\Theta_m,1,S_m}(x)}{u(T, x)} \right|^2 \right] \right)^{1/2}
\]

(133)

for \( m \in \{0, 10000, 50000, 100000, 150000, 200000, 500000, 750000\} \) by means of Monte Carlo approximations with 10240000 samples for the supremum (see Lemma 3.5 below) and 5 samples for the expectation. The following elementary result, Lemma 3.2 below, specifies the explicit solution of the PDE (126) above (cf. (127) above). For completeness we also provide here a proof for Lemma 3.2.

Lemma 3.2. Let $T \in (0, \infty)$, $d \in \mathbb{N}$, let $C \in \mathbb{R}^{d \times d}$ be a strictly positive and symmetric matrix, and let $u : [0, T] \times \mathbb{R}^d \to \mathbb{R}$ be the function which satisfies for every $(t,x) \in [0, T] \times \mathbb{R}^d$ that

$$u(t,x) = \|x\|^2_{\mathbb{R}^d} + t \text{Trace}_{\mathbb{R}^d}(C).$$

(134)

Then

(i) it holds that $u \in C^\infty([0,T] \times \mathbb{R}^d, \mathbb{R})$ is at most polynomially growing and

(ii) it holds for every $t \in [0,T]$, $x \in \mathbb{R}^d$ that

$$\left(\frac{\partial u}{\partial t}\right)(t,x) = \frac{1}{2} \text{Trace}_{\mathbb{R}^d}(C(Hess_x u)(t,x)).$$

(135)

Proof of Lemma 3.2. First, note that $u$ is a polynomial. This establishes item (i). Moreover, note that for every $(t,x) \in [0,T] \times \mathbb{R}^d$ it holds that

$$\left(\frac{\partial u}{\partial t}\right)(t,x) = \text{Trace}_{\mathbb{R}^d}(C), \quad (\nabla_x u)(t,x) = 2x, \quad (\text{Hess}_x u)(t,x) = \left(\frac{\partial}{\partial x}(\nabla_x u)\right)(t,x) = 2 \text{Id}_{\mathbb{R}^d}.$$  
(136)

Hence, we obtain for every $(t,x) \in [0,T] \times \mathbb{R}^d$ that

$$\left(\frac{\partial u}{\partial t}\right)(t,x) - \frac{1}{2} \text{Trace}_{\mathbb{R}^d}(C(Hess_x u)(t,x)) = \text{Trace}_{\mathbb{R}^d}(C) - \frac{1}{2} \text{Trace}_{\mathbb{R}^d}(2C) = 0.$$  
(138)

This proves item (ii). The proof of Lemma 3.2 is thus completed.
Lemma 3.5 below discloses the strategy how we approximatively calculate the $L_\infty(\lambda_{[0,1]};\mathbb{R})$-errors in (130) and (133) above. Our proof of Lemma 3.5 employs the elementary auxiliary results in Lemma 3.3 and Lemma 3.4 below. For completeness we also include proofs for Lemma 3.3 and Lemma 3.4 here.

**Lemma 3.3.** Let $(\Omega,\mathcal{F},\mathbb{P})$ be a probability space and let $A,\mathcal{O}\in\mathcal{F}$ satisfy that $\mathbb{P}(\mathcal{O}) = 1$. Then it holds that

$$P(A) = P(A \cap \mathcal{O}).$$  

(139)

**Proof of Lemma 3.3.** Observe that the monotonicity of $\mathbb{P}$ ensures that

$$P(A \cap \mathcal{O}) \leq P(A) = P([A \cap \mathcal{O}] \cup [A \setminus (A \cap \mathcal{O})])$$

$$= P(A \cap \mathcal{O}) + P(A \setminus (A \cap \mathcal{O}))$$

$$= P(A \cap \mathcal{O}) + P(A \setminus \mathcal{O})$$

$$\leq P(A \cap \mathcal{O}) + P(\mathcal{O} \setminus \mathcal{O})$$

$$= P(A \cap \mathcal{O}) + P(\mathcal{O} \setminus \mathcal{O}) = P(A \cap \mathcal{O}).$$

Hence, we obtain that for every $A,\mathcal{O}\in\mathcal{F}$ with $\mathbb{P}(\mathcal{O}) = 1$ it holds that $P(A) = P(A \cap \mathcal{O})$. The Proof of Lemma 3.3 is thus completed. □

**Lemma 3.4.** Let $(\Omega,\mathcal{F},\mathbb{P})$ be a probability space, let $X_n: \Omega \rightarrow [0,\infty)$, $n \in \mathbb{N}_0$, be random variables, assume for every $n \in \mathbb{N}$ that $\mathbb{P}(X_n \geq X_{n+1}) = 1$, and assume for every $\varepsilon \in (0,\infty)$ that

$$\limsup_{n \to \infty} \mathbb{P}(X_n > \varepsilon) = 0.$$  

(141)

Then

$$\mathbb{P}\left(\limsup_{n \to \infty} X_n = 0\right) = 1.$$  

(142)

**Proof of Lemma 3.4.** Throughout this proof let $\mathcal{O} \subseteq \Omega$ be the set given by

$$\mathcal{O} = \cap_{n=1}^{\infty} \{X_n \geq X_{n+1}\} = \{\forall n \in \mathbb{N}: X_n \geq X_{n+1}\}.$$  

(143)

Observe that Lemma 3.3 and the hypothesis that for every $n \in \mathbb{N}$ it holds that $\mathbb{P}(X_n \geq X_{n+1}) = 1$ assure that for every $N \in \mathbb{N}$ it holds that

$$\mathbb{P}(\cap_{n=1}^{N} \{X_n \geq X_{n+1}\}) = \mathbb{P}(\cap_{n=1}^{N-1} \{X_n \geq X_{n+1}\} \cap \{X_N \geq X_{N+1}\})$$

$$= \mathbb{P}(\cap_{n=1}^{N-1} \{X_n \geq X_{n+1}\}).$$

(144)

This implies that for every $N \in \mathbb{N}$ it holds that

$$\mathbb{P}(\cap_{n=1}^{N} \{X_n \geq X_{n+1}\}) = \mathbb{P}(\cap_{n=1}^{0} \{X_n \geq X_{n+1}\})$$

$$= \mathbb{P}(\Omega) = 1.$$  

(145)
The fact that the measure $P$ is continuous from above hence demonstrates that
\[
P(\mathcal{O}) = P(\cap_{n=1}^{\infty} \{X_n \geq X_{n+1}\}) = P(\cap_{N=1}^{\infty} \cap_{n=1}^{N} \{X_n \geq X_{n+1}\}) = \lim_{N \to \infty} P(\cap_{n=1}^{N} \{X_n \geq X_{n+1}\}) = 1. \tag{146}
\]

Next note that
\[
P\left(\limsup_{n \to \infty} X_n > 0\right) = P\left(\exists k \in \mathbb{N}: \limsup_{n \to \infty} X_n > \frac{1}{k}\right)
= P\left(\exists k \in \mathbb{N}: \forall m \in \mathbb{N}: \exists n \in \mathbb{N} \cap [m, \infty): X_n > \frac{1}{k}\right)
= P\left(\cup_{k \in \mathbb{N}} \cap_{m \in \mathbb{N}} \cup_{n \in \mathbb{N} \cap [m, \infty)} \{X_n > \frac{1}{k}\}\right) \tag{147}
\leq \sum_{k=1}^{\infty} P\left(\cap_{m=1}^{\infty} \cup_{n=m}^{\infty} \{X_n > \frac{1}{k}\}\right)
= \sum_{k=1}^{\infty} \left[\limsup_{m \to \infty} P(\cup_{n=m}^{\infty} \{X_n > \frac{1}{k}\})\right].
\]

Lemma 3.3 and (146) therefore ensure that
\[
P\left(\limsup_{n \to \infty} X_n > 0\right)
\leq \sum_{k=1}^{\infty} \left[\limsup_{m \to \infty} P(\cup_{n=m}^{\infty} \{X_n > \frac{1}{k}\})\right]
\leq \sum_{k=1}^{\infty} \left[\limsup_{m \to \infty} P\left(\{X_m > \frac{1}{k}\} \cap \{\forall n \in \mathbb{N} \cap [m, \infty): X_m \geq X_n\}\right)\right] \tag{148}
= \sum_{k=1}^{\infty} \left[\limsup_{m \to \infty} P\left(\{X_m > \frac{1}{k}\} \cap \{\forall n \in \mathbb{N} \cap [m, \infty): X_m \geq X_n\}\right)\right]
\leq \sum_{k=1}^{\infty} \left[\limsup_{m \to \infty} P(X_m > \frac{1}{k})\right].
\]

Combining this and (141) establishes (142). The proof of Lemma 3.4 is thus completed. \qed

**Lemma 3.5.** Let $d \in \mathbb{N}$, $a \in \mathbb{R}$, $b \in (a, \infty)$, let $f: [a,b]^d \to \mathbb{R}$ be a continuous function, let $(\Omega, \mathcal{F}, P)$ be a probability space, let $X_n: \Omega \to [a,b]^d$, $n \in \mathbb{N}$, be i.i.d. random variables, and assume that $X_1$ is continuous uniformly distributed on $[a,b]^d$. Then
(i) it holds that
\[ P \left( \lim_{N \to \infty} \left[ \max_{1 \leq n \leq N} f(X_n) - \left( \sup_{x \in [a,b]^d} f(x) \right) \right] = 0 \right) = 1 \] (149)
and
(ii) it holds for every \( p \in (0, \infty) \) that
\[ \lim_{N \to \infty} \mathbb{E} \left[ \left[ \max_{1 \leq n \leq N} f(X_n) - \left( \sup_{x \in [a,b]^d} f(x) \right) \right]^p \right] = 0. \] (150)

Proof of Lemma 3.5. First, observe that the fact that \( f : [a, b]^d \to \mathbb{R} \) is a continuous function and the fact that \([a, b]^d \subseteq \mathbb{R}^d\) is a compact set demonstrate that there exists \( \xi \in [a, b]^d \) which satisfies that \( f(\xi) = \sup_{x \in [a,b]^d} f(x) \). Next note that the fact that for every \( N \in \mathbb{N}, n \in \{1, 2, \ldots, N\} \) it holds that \( f(X_n) \leq \sup_{x \in [a,b]^d} f(x) \) implies that for every \( N \in \mathbb{N} \) it holds that \( \max_{1 \leq n \leq N} f(X_n) \leq \sup_{x \in [a,b]^d} f(x) \). Hence, we obtain that for every \( N \in \mathbb{N} \) it holds that
\[ \left[ \max_{1 \leq n \leq N} f(X_n) - \sup_{x \in [a,b]^d} f(x) \right] = \left[ \sup_{x \in [a,b]^d} f(x) \right] - \left[ \max_{1 \leq n \leq N} f(X_n) \right]. \] (151)
Combining this with the fact that \( f(\xi) = \sup_{x \in \mathbb{R}^d} f(x) \) ensures that for every \( \varepsilon \in (0, \infty) \), \( N \in \mathbb{N} \) it holds that
\[ \{ \max_{1 \leq n \leq N} f(X_n) - \sup_{x \in [a,b]^d} f(x) \leq \varepsilon \} \]
\[ = \{ \max_{1 \leq n \leq N} f(X_n) \geq \sup_{x \in [a,b]^d} f(x) - \varepsilon \} \]
\[ = \bigcup_{n=1}^{N} \{ f(X_n) \geq \sup_{x \in [a,b]^d} f(x) - \varepsilon \} = \bigcup_{n=1}^{N} \{ |f(X_n) - \sup_{x \in [a,b]^d} f(x)| \leq \varepsilon \} \] (152)
In the next step we observe that the fact that \( f : [a, b]^d \to \mathbb{R} \) is continuous ensures that for every \( \varepsilon \in (0, \infty) \) there exists \( \delta \in (0, \infty) \) such that for every \( x \in [a, b]^d \) with \( \|x - \xi\|_{\mathbb{R}^d} \leq \delta \) it holds that \( |f(x) - f(\xi)| \leq \varepsilon \). Combining this and (152) shows that for every \( \varepsilon \in (0, \infty) \) there exists \( \delta \in (0, \infty) \) such that for every \( N \in \mathbb{N} \) it holds that
\[ P \left( \bigcup_{n=1}^{N} \{ \|X_n - \xi\|_{\mathbb{R}^d} \leq \delta \} \right) = 1 - P \left( \bigcap_{n=1}^{N} \{ \|X_n - \xi\|_{\mathbb{R}^d} > \delta \} \right). \] (153)
Hence, we obtain that for every \( \varepsilon \in (0, \infty) \) there exists \( \delta \in (0, \infty) \) such that
\[ \lim_{N \to \infty} P \left( \max_{1 \leq n \leq N} f(X_n) - \sup_{x \in [a,b]} f(x) \right) \leq \varepsilon \]
\[ \geq 1 - \lim_{N \to \infty} P \left( \bigcap_{n=1}^{N} \{ \|X_n - \xi\|_{\mathbb{R}^d} > \delta \} \right). \] (154)
Next observe that the fact that the random variables $X_n: \Omega \to [a,b]^d$, $n \in \{1,2,\ldots,N\}$, are i.i.d. ensures that for every $\delta \in (0,\infty)$, $N \in \mathbb{N}$ it holds that

$$\mathbb{P}\left( \bigcap_{n=1}^{N} \{ \|X_n - \xi\|_{R^d} > \delta \} \right) = \prod_{n=1}^{N} \mathbb{P}(\|X_n - \xi\|_{R^d} > \delta)$$

$$= \left[ \mathbb{P}(\|X_1 - \xi\|_{R^d} > \delta) \right]^N. \quad (155)$$

In addition, note that the fact that for every $\delta \in (0,\infty)$ it holds that the set \{ $x \in [a,b]^d: \|x - \xi\|_{R^d} \leq \delta$ \} $\subseteq \mathbb{R}^d$ has strictly positive $d$-dimensional Lebesgue measure and the fact that $X_1$ is continuous uniformly distributed on $[a,b]^d$ ensure that for every $\delta \in (0,\infty)$ it holds that

$$\mathbb{P}(\|X_1 - \xi\|_{R^d} > \delta) = 1 - \mathbb{P}(\|X_1 - \xi\|_{R^d} \leq \delta) < 1. \quad (156)$$

Hence, we obtain that for every $\delta \in (0,\infty)$ it holds that

$$\limsup_{N \to \infty} \left[ \mathbb{P}(\|X_1 - \xi\|_{R^d} > \delta) \right]^N = 0. \quad (157)$$

Combining this with (155) demonstrates that for every $\delta \in (0,\infty)$ it holds that

$$\limsup_{N \to \infty} \mathbb{P}\left( \bigcap_{n=1}^{N} \{ \|X_n - \xi\|_{R^d} > \delta \} \right) = 0. \quad (158)$$

This and (154) assure that for every $\varepsilon \in (0,\infty)$ it holds that

$$\liminf_{N \to \infty} \mathbb{P}\left( \max_{1 \leq n \leq N} f(X_n) - \sup_{x \in [a,b]^d} f(x) \leq \varepsilon \right) = 1. \quad (159)$$

Therefore, we obtain that for every $\varepsilon \in (0,\infty)$ it holds that

$$\limsup_{N \to \infty} \mathbb{P}\left( \max_{1 \leq n \leq N} f(X_n) - \sup_{x \in [a,b]^d} f(x) > \varepsilon \right) = 0. \quad (160)$$

Combining this with with Lemma 3.4 establishes item (i). It thus remains to prove item (ii). For this note that the fact that $f: [a,b]^d \to \mathbb{R}$ is globally bounded, item (i), and Lebesgue’s dominated convergence theorem ensure that for every $p \in (0,\infty)$ it holds that

$$\limsup_{N \to \infty} \mathbb{E}\left[ \max_{1 \leq i \leq N} f(X_i) - \sup_{x \in [a,b]^d} f(x) \right]^p = 0. \quad (161)$$

This establishes item (ii). The proof of Lemma 3.5 is thus completed. \qed

35
3.3 Geometric Brownian motions

In this subsection we apply the proposed approximation algorithm to a Black-Scholes PDE with independent underlying geometric Brownian motions.

Assume Framework 2.10 let \( r = \frac{1}{20}, \mu = r - \frac{1}{10} = -\frac{1}{10}, \sigma_1 = \frac{1}{10} + \frac{1}{200}, \sigma_2 = \frac{1}{10} + \frac{2}{200}, \ldots, \sigma_{100} = \frac{1}{10} + \frac{100}{200} \), assume for every \( s, t \in [0, T], x = (x_1, x_2, \ldots, x_d), w = (w_1, w_2, \ldots, w_d) \in \mathbb{R}^d, m \in \mathbb{N}_0 \) that \( N = 1, d = 100, \varphi(x) = \exp(-rT) \max\{ \max_{i \in \{1, 2, \ldots, d\}} x_i - 100, 0 \} \), and

\[
H(s, t, x, w) = \left( x_1 \exp\left( \left( \mu_1 - \frac{|\sigma_1|^2}{2} \right) t + \sigma_1 w_1 \right), \ldots, x_d \exp\left( \left( \mu_d - \frac{|\sigma_d|^2}{2} \right) t + \sigma_d w_d \right) \right),
\]

(162)

assume that \( \xi^{0,1} : \Omega \to \mathbb{R}^d \) is continuous uniformly distributed on \([90, 110]^d\), and let \( u = (u(t, x))(t, x) \in C^{1,2}([0, T] \times \mathbb{R}^d, \mathbb{R}) \) be an at most polynomially growing function which satisfies for every \( t \in [0, T], x \in \mathbb{R}^d \) that \( u(0, x) = \varphi(x) \) and

\[
(\frac{\partial u}{\partial t})(t, x) = \frac{1}{2} \sum_{i=1}^{d} \left| \sigma_i x_i \right|^2 (\frac{\partial^2 u}{\partial x^2})(t, x) + \sum_{i=1}^{d} \mu_i x_i (\frac{\partial u}{\partial x_i})(t, x).
\]

(163)

The Feynman-Kac formula (cf., for example, Hairer et al. [22, Corollary 4.17]) shows that for every standard Brownian motion \( W = (W^{(1)}, \ldots, W^{(d)}): [0, T] \times \Omega \to \mathbb{R}^d \) and every \( t \in [0, T], x = (x_1, \ldots, x_d) \in \mathbb{R}^d \) it holds that

\[
u(t, x) = \mathbb{E} \left[ \varphi \left( x_1 \exp \left( \sigma_1 W^{(1)}_t + \left( \mu_1 - \frac{|\sigma_1|^2}{2} \right) t \right), \ldots, x_d \exp \left( \sigma_d W^{(d)}_t + \left( \mu_d - \frac{|\sigma_d|^2}{2} \right) t \right) \right] \right].
\]

(164)

Table 3 approximately presents the relative \( L^1(\lambda_{[0,1]^d}; \mathbb{R}) \)-approximation error associated to \((\mathbb{U}^{\Theta_m,1,S_m}(x))_{x \in [0,1]^d}\) (see (165) below), the relative \( L^2(\lambda_{[0,1]^d}; \mathbb{R}) \)-approximation error associated to \((\mathbb{U}^{\Theta_m,1,S_m}(x))_{x \in [0,1]^d}\) (see (166) below), and the relative \( L^\infty(\lambda_{[0,1]^d}; \mathbb{R}) \)-approximation error associated to \((\mathbb{U}^{\Theta_m,1,S_m}(x))_{x \in [0,1]^d}\) (see (167) below) against \( m \in \{0, 25000, 50000, 100000, 150000, 250000, 500000, 750000\} \) (cf. PYTHON code 3 in Subsection 4.3 below).

In our numerical simulations for Table 3 we approximately calculated the exact solution of the PDE (163) by means of (164) and Monte Carlo approximations with 1048576 samples, we approximately calculated the relative \( L^1(\lambda_{[0,1]^d}; \mathbb{R}) \)-approximation error

\[
\int_{[0,1]^d} \left| \frac{u(T, x) - \mathbb{U}^{\Theta_m,1,S_m}(x)}{u(T, x)} \right| dx
\]

(165)

for \( m \in \{0, 25000, 50000, 100000, 150000, 250000, 500000, 750000\} \) by means of Monte Carlo approximations with 81920 samples, we approximately calculated the relative \( L^2(\lambda_{[0,1]^d}; \mathbb{R}) \)-approximation error

\[
\sqrt{\int_{[0,1]^d} \left( \frac{u(T, x) - \mathbb{U}^{\Theta_m,1,S_m}(x)}{u(T, x)} \right)^2 dx}
\]

(166)
for \( m \in \{0, 25000, 50000, 100000, 150000, 250000, 500000, 750000\} \) by means of Monte Carlo approximations with 81920 samples, and we approximately calculated the relative \( L^\infty(\lambda_{[0,1]^d}; \mathbb{R}) \)-approximation error

\[
\sup_{x \in [0,1]^d} \left| \frac{u(T,x) - \mathbb{U}_{m,1,S_m}(x)}{u(T,x)} \right|
\]

for \( m \in \{0, 25000, 50000, 100000, 150000, 250000, 500000, 750000\} \) by means of Monte Carlo approximations with 81920 samples (see Lemma 3.5 above).

#### 3.4 Black-Scholes model with correlated noise

In this subsection we apply the proposed approximation algorithm to a Black-Scholes PDE with correlated noise.

Assume Framework 2.10 let \( r = \frac{1}{20}, \mu = r - \frac{1}{10} = -\frac{1}{20}, \beta_1 = \frac{1}{10} + \frac{1}{200}, \beta_2 = \frac{1}{10} + \frac{2}{200} \), \( \beta_{100} = \frac{1}{10} + \frac{100}{200} \), \( Q = (Q_{i,j})(i,j) \in \{1,2,\ldots,100\} \), \( \Sigma = \Sigma_{i,j} \in \{1,2,\ldots,100\} \) \( Q_{i,j} \in \mathbb{R}^{100} \), \( \Sigma_{i,j} \in \mathbb{R}^{100} \), for every \( s, t \in [0,T] \), \( x = (x_1, x_2, \ldots, x_d) \), \( w = (w_1, w_2, \ldots, w_d) \), \( m \in \mathbb{N}_0 \), \( i,j,k \in \{1,2,\ldots,100\} \), \( i < j < k \), \( N = 1 \), \( d = 100 \), \( \nu = d(2d) + (2d)^2 + 2d = 2d(3d + 1) \), \( Q_{k,k} = 1 \), \( Q_{i,j} = Q_{j,i} = \frac{1}{2} \), \( \Sigma_{i,j} = 0 \), \( \Sigma_{k,k} > 0 \), \( \Sigma \Sigma^* = Q \) (cf., for example, Golub & Van Loan [19, Theorem 4.2.5]), \( \zeta_k = (\Sigma_{k,1}, \ldots, \Sigma_{k,100}) \), \( \varphi(x) = \exp(-\mu T) \max \{110 - \min_{i \in \{1,2,\ldots,d\}} x_i, 0\} \), and

\[
H(s,t,x,w) = \left( x_1 \exp\left( (\mu - \frac{1}{2}\|\beta_1 s_1\|_{\mathbb{R}^d}^2)(t-s) + \langle s_1, w \rangle_{\mathbb{R}^d} \right) \right) \ldots \left( x_d \exp\left( (\mu - \frac{1}{2}\|\beta_d s_d\|_{\mathbb{R}^d}^2)(t-s) + \langle s_d, w \rangle_{\mathbb{R}^d} \right) \right).
\]

(168)
assume that $\xi^{0.1}: \Omega \to \mathbb{R}^d$ is continuous uniformly distributed on $[90, 110]^d$, and let $u = (u(t, x))_{t \in [0, T], x \in \mathbb{R}^d} \in C^{1,2}([0, T] \times \mathbb{R}^d, \mathbb{R})$ be an at most polynomially growing continuous function which satisfies for every $t \in [0, T]$, $x \in \mathbb{R}^d$ that $u(0, x) = \varphi(x)$ and

$$
(\frac{\partial u}{\partial t})(t, x) = \frac{1}{2} \sum_{i,j=1}^{d} x_i x_j \beta_i \beta_j \langle \xi_i, \xi_j \rangle_{\mathbb{R}^d} (\frac{\partial^2 u}{\partial x_i \partial x_j})(t, x) + \sum_{i=1}^{d} \mu_i x_i (\frac{\partial u}{\partial x_i})(t, x). \tag{169}
$$

The Feynman-Kac formula (cf., for example, Hairer et al. [22, Corollary 4.17]) shows that for every standard Brownian motion $W = (W^{(1)}, \ldots, W^{(d)}): [0, T] \times \Omega \to \mathbb{R}^d$ and every $t \in [0, T]$, $x = (x_1, \ldots, x_d) \in \mathbb{R}^d$ it holds that

$$
u(t, x) = \mathbb{E} \left[ \varphi \left( x_1 \exp \left( \left\langle \xi_1, W^{(1)}_t \right\rangle_{\mathbb{R}^d} + \left( \mu_1 - \frac{\|\beta_1 \xi_1\|_{\mathbb{R}^d}^2}{2} \right) t \right) \right), \ldots, \right]

x_d \exp \left( \left\langle \xi_d, W^{(d)}_t \right\rangle_{\mathbb{R}^d} + \left( \mu_d - \frac{\|\beta_d \xi_d\|_{\mathbb{R}^d}^2}{2} \right) t \right) \right] \right]. \tag{170}
$$

Table 4 approximately presents the relative $L^1(\lambda_{[0,1]^d}; \mathbb{R})$-approximation error associated to $(U^{\theta_{m,1,500}}(x))_{x \in [0,1]^d}$ (see (171) below), the relative $L^2(\lambda_{[0,1]^d}; \mathbb{R})$-approximation error associated to $(U^{\theta_{m,1,500}}(x))_{x \in [0,1]^d}$ (see (172) below), and the relative $L^\infty(\lambda_{[0,1]^d}; \mathbb{R})$-approximation error associated to $(U^{\theta_{m,1,500}}(x))_{x \in [0,1]^d}$ (see (173) below) against $m \in \{0, 25000, 50000, 100000, 150000, 250000, 500000, 750000\}$ (cf. PYTHON code 4 in Subsection 3.4 below). In our numerical simulations for Table 4, we approximately calculated the exact solution of the PDE (169) by means of (170) and Monte Carlo approximations with 1048576 samples, we approximately calculated the relative $L^1(\lambda_{[0,1]^d}; \mathbb{R})$-approximation error

$$
\int_{[0,1]^d} \frac{|u(T, x) - U^{\theta_{m,1,500}}(x)|}{u(T, x)} \, dx \tag{171}
$$

for $m \in \{0, 25000, 50000, 100000, 150000, 250000, 500000, 750000\}$ by means of Monte Carlo approximations with 81920 samples, we approximately calculated the relative $L^2(\lambda_{[0,1]^d}; \mathbb{R})$-approximation error

$$
\sqrt{\int_{[0,1]^d} \frac{|u(T, x) - U^{\theta_{m,1,500}}(x)|^2}{u(T, x)} \, dx} \tag{172}
$$

for $m \in \{0, 25000, 50000, 100000, 150000, 250000, 500000, 750000\}$ by means of Monte Carlo approximations with 81920 samples, and we approximately calculated the relative $L^\infty(\lambda_{[0,1]^d}; \mathbb{R})$-approximation error

$$
\sup_{x \in [0,1]^d} \frac{|u(T, x) - U^{\theta_{m,1,500}}(x)|}{u(T, x)} \tag{173}
$$

for $m \in \{0, 25000, 50000, 100000, 150000, 250000, 500000, 750000\}$ by means of Monte Carlo approximations with 81920 samples (see Lemma 3.3 above).

3.5 Stochastic Lorenz equations

In this subsection we apply the proposed approximation algorithm to the stochastic Lorenz equation.

Assume Framework 2.10 let \(\alpha_1 = 10\), \(\alpha_2 = 14\), \(\alpha_3 = \frac{8}{3}\), \(\beta = \frac{3}{2}\), let \(\mu: \mathbb{R}^d \to \mathbb{R}^d\) be a function, assume for every \(s, t \in [0, T]\), \(x = (x_1, x_2, \ldots, x_d)\), \(w = (w_1, w_2, \ldots, w_d) \in \mathbb{R}^d\), \(m \in \mathbb{N}_0\) that \(N = 100\), \(d = 3\), \(\nu = (d + 20)d + (d + 20)^2 + (d + 20) = (d + 20)(2d + 21)\), \(\mu(x) = (\alpha_1(x_2 - x_1), \alpha_2x_1 - x_2 - x_1x_3, x_1x_2 - \alpha_3x_3)\), \(\varphi(x) = \|x\|^2_{\mathbb{R}^d}\), and

\[
H(s, t, x, w) = x + \mu(x)(t-s)\mathbb{1}_{[0,N/T]}(\|\mu(x)\|_{\mathbb{R}^d}) + \beta w
\]  
(174)

(cf., for example, Hutzenthaler et al. [32], Hutzenthaler et al. [33], Milstein & Tretyakov [38], Sabanis [54, 55], and the references mentioned therein for related temporal numerical approximation schemes for SDEs), assume that \(\xi^0_1: \Omega \to \mathbb{R}^d\) is continuous uniformly distributed on \([\frac{1}{2}, \frac{3}{2}] \times [8, 10] \times [10, 12]\), and let \(u = (u(t, x))(t,x)\in[0,T]\times\mathbb{R}^d \in C^{1,2}([0,T] \times \mathbb{R}^d, \mathbb{R})\) be an at most polynomially growing function (cf., for example, Hairer et al. [22 Corollary 4.17] and Hörmander [31 Theorem 1.1]) which satisfies for every \(t \in [0, T]\), \(x \in \mathbb{R}^d\) that \(u(0, x) = \varphi(x)\) and

\[
\begin{align*}
\frac{d}{dt}(t, x) = & \frac{\beta^2}{2}(\Delta_x u)(t, x) + \alpha_1(x_2 - x_1)(\frac{\partial u}{\partial x_1})(t, x) \\
& + (\alpha_2x_1 - x_2 - x_1x_3)(\frac{\partial u}{\partial x_2})(t, x) + (x_1x_2 - \alpha_3x_3)(\frac{\partial u}{\partial x_3})(t, x).
\end{align*}
\]  
(175)

Table 5 approximately presents the relative \(L^1(\lambda_{0,1}^t; \mathbb{R})\)-approximation error associated to \((U_{\Theta_m,1}^{\lambda_{0,1}^t}(x))]_{x \in [0,1]^d}\) (see (176) below), the relative \(L^2(\lambda_{0,1}^t; \mathbb{R})\)-approximation error associated to \((U_{\Theta_m,1}^{\lambda_{0,1}^t}(x))]_{x \in [0,1]^d}\) (see (177) below), and the relative \(L^\infty(\lambda_{0,1}^t; \mathbb{R})\)-approximation error associated to \((U_{\Theta_m,1}^{\lambda_{0,1}^t}(x))]_{x \in [0,1]^d}\) (see (178) below) against \(m \in \{0, 25000, 50000, 75000\} \).
In our numerical simulations for Table 5 we approximately calculated the exact solution of the PDE (175) by means of Monte Carlo approximations with 104857 samples and temporal SDE-discretizations based on (174) and 100 equidistant time steps, we approximately calculated the relative $L^1(\lambda_{[0,1]^d}; \mathbb{R})$-approximation error
\[
\int_{[0,1]^d} \left| \frac{u(T,x) - U^{\Theta_m,1,S_m}(x)}{u(T,x)} \right| dx
\] (176)
for $m \in \{0, 25000, 50000, 100000, 150000, 250000, 500000, 750000\}$ by means of Monte Carlo approximations with 20480 samples, and we approximately calculated the relative $L^2(\lambda_{[0,1]^d}; \mathbb{R})$-approximation error
\[
\sqrt{\int_{[0,1]^d} \left| \frac{u(T,x) - U^{\Theta_m,1,S_m}(x)}{u(T,x)} \right|^2 dx}
\] (177)
for $m \in \{0, 25000, 50000, 100000, 150000, 250000, 500000, 750000\}$ by means of Monte Carlo approximations with 20480 samples, and we approximately calculated the relative $L^\infty(\lambda_{[0,1]^d}; \mathbb{R})$-approximation error
\[
\sup_{x \in [0,1]^d} \left| \frac{u(T,x) - U^{\Theta_m,1,S_m}(x)}{u(T,x)} \right|
\] (178)
for $m \in \{0, 25000, 50000, 100000, 150000, 250000, 500000, 750000\}$ by means of Monte Carlo approximations with 20480 samples (see Lemma 3.5 above).

### 3.6 Heston model

In this subsection we apply the proposed approximation algorithm to the Heston model in (180) below.
Assume Framework 2.10 let $\delta = 25$, $\alpha = \frac{1}{20}$, $\kappa = \frac{6}{50}$, $\theta = \frac{1}{25}$, $\beta = \frac{1}{5}$, $\varrho = -\frac{1}{5}$, let $e_i \in \mathbb{R}^{50}$, $i \in \{1, 2, \ldots, 50\}$, be the vectors which satisfy that $e_1 = (1, 0, 0, \ldots, 0, 0) \in \mathbb{R}^{50}$, $e_2 = (0, 1, 0, \ldots, 0, 0) \in \mathbb{R}^{50}$, $\ldots$, $e_{50} = (0, 0, 0, \ldots, 0, 1) \in \mathbb{R}^{50}$, assume for every $s, t \in [0, T]$, $x = (x_1, x_2, \ldots, x_d)$, $w = (w_1, w_2, \ldots, w_d) \in \mathbb{R}^d$ that $N = 100$, $d = 2\delta = 50$, $\nu = (d + 50)d + (d + 50)^2 + (d + 50) = (d + 50)(2d + 51)$, $\varphi(x) = \exp(-\alpha T)\max\{110 - [\sum_{i=1}^{\delta} x_{2i-1}], 0\}$, and

$$H(s, t, x, w) = \sum_{i=1}^{\delta} \left( \left[ x_{2i-1} \exp\left( (\alpha - \frac{\varrho}{2}) (t - s) + w_{2i-1}\sqrt{x_{2i}} \right) \right] e_{2i-1} \right.$$  
$$+ \left[ \max\left\{ \max\left\{ \frac{\beta}{2} \sqrt{t - s, \max\{ \frac{\beta}{2} \sqrt{t - s, \sqrt{x_{2i}}} + \frac{\beta}{2} \rho w_{2i-1} + [1 - \rho^2]\}^2 \right\})^2 \right\} + (\kappa \theta - \frac{\beta^2}{4} - \kappa x_{2i}) (t - s), 0 \right\} e_{2i} \right) \right)$$  
(179)

(cf. Hefter & Herzwurm [25, Section 1]), assume that $\xi^{0.1} : \Omega \rightarrow \mathbb{R}^d$ is continuous uniformly distributed on $x_{\delta} = [90, 110] \times [0.02, 0.2]$, and let $u = (u(t, x))_{(t, x) \in [0, T] \times \mathbb{R}^d} \in C^{1,2}([0, T] \times \mathbb{R}^d)$ be an at most polynomially growing function (cf., for example, Alfonsi [11, Proposition 4.1]) which satisfies for every $t \in [0, T]$, $x \in \mathbb{R}^d$ that $u(0, x) = \varphi(x)$ and

$$\left( \frac{\partial u}{\partial t} \right)(t, x) = \sum_{i=1}^{\delta} \left( \alpha x_{2i-1}(\frac{\partial u}{\partial x_{2i-1}})(t, x) + (\kappa \theta - x_{2i}) (\frac{\partial u}{\partial x_{2i}})(t, x) \right)$$  
$$+ \left[ \sum_{i=1}^{\delta} \frac{|x_{2i}|}{2} \left( |x_{2i-1}| (\frac{\partial^2 u}{\partial x_{2i-1}^2})(t, x) + 2x_{2i-1}\beta \varrho (\frac{\partial^2 u}{\partial x_{2i-1}\partial x_{2i}})(t, x) + \beta^2 (\frac{\partial^2 u}{\partial x_{2i}^2})(t, x) \right) \right) \right)$$  
(180)

Table 6 approximately presents the relative $L^1(\lambda_{[0,1]^d}; \mathbb{R})$-approximation error associated to $(U_{\Theta m,1,5m}(x))_{x \in [0,1]^d}$ (see (181) below), the relative $L^2(\lambda_{[0,1]^d}; \mathbb{R})$-approximation error associated to $(U_{\Theta m,1,5m}(x))_{x \in [0,1]^d}$ (see (182) below), and the relative $L^\infty(\lambda_{[0,1]^d}; \mathbb{R})$-approximation error associated to $(U_{\Theta m,1,5m}(x))_{x \in [0,1]^d}$ (see (183) below) against $m \in \{0, 25000, 50000, 100000, 150000, 250000, 500000, 750000 \}$ (cf. PYTHON code 6 in Subsection 4.6 below). In our numerical simulations for Table 6 we approximately calculated the exact solution of the PDE (180) by means of Monte Carlo approximations with 104576 samples and temporal SDE-discretizations based on (179) and 100 equidistant time steps, we approximately calculated the relative $L^1(\lambda_{[0,1]^d}; \mathbb{R})$-approximation error

$$\int_{[0,1]^d} \left| \frac{u(T, x) - U_{\Theta m,1,5m}(x)}{u(T, x)} \right| \, dx$$  
(181)

for $m \in \{0, 25000, 50000, 100000, 150000, 250000, 500000, 750000 \}$ by means of Monte Carlo
approximations with 10240 samples, we approximately calculated the relative $L^2(\lambda_{[0,1]^d};\mathbb{R})$-approximation error
\[
\sqrt{\int_{[0,1]^d} \frac{|u(T, x) - \bar{u}_{\theta,m,1,S_m}(x)|^2}{u(T, x)} \, dx}
\]
for $m \in \{0, 25000, 50000, 100000, 150000, 250000, 500000, 750000\}$ by means of Monte Carlo approximations with 10240 samples, and we approximately calculated the relative $L^\infty(\lambda_{[0,1]^d};\mathbb{R})$-approximation error
\[
\sup_{x \in [0,1]^d} \frac{|u(T, x) - \bar{u}_{\theta,m,1,S_m}(x)|}{u(T, x)}
\]
for $m \in \{0, 25000, 50000, 100000, 150000, 250000, 500000, 750000\}$ by means of Monte Carlo approximations with 10240 samples (see Lemma 3.5 above).

4 Python source codes

4.1 Python source code for the algorithm

In Subsections 4.2–4.6 below we present Python source codes associated to the numerical simulations in Subsections 3.2–3.6 above. The following Python source code, Python code 1 below, is employed in the case of each of the Python source codes in Subsections 4.2–4.6 below.

Python code 1: common.py

```python
1 import numpy as np
2 import tensorflow as tf
```
import time
from tensorflow.python.ops import init_ops
from tensorflow.contrib.layers.python.layers import initializers
from tensorflow.python.training.moving_averages import assign_moving_average

def neural_net(x, neurons, is_training, name,
    mv_decay=0.9, dtype=tf.float32):
    
def _batch_normalization(_x):
        beta = tf.get_variable('beta', [_x.get_shape()[-1]],
            dtype, init_ops.zeros_initializer())
        gamma = tf.get_variable('gamma', [_x.get_shape()[-1]],
            dtype, init_ops.ones_initializer())
        mv_mean = tf.get_variable('mv_mean', [_x.get_shape()[-1]],
            dtype, init_ops.zeros_initializer(),
            trainable=False)
        mv_variance = tf.get_variable('mv_variance', [_x.get_shape()[-1]],
            dtype, init_ops.ones_initializer(),
            trainable=False)
